The only problem I see with this is that you will have to change the
battery on the tortoise pretty regularly. If you have just the receiver
on the tortoise and only go into a 'wake-up' condition upon receipt of a
signal from your transmitter you will get extended life. If the receiver
```

then triggers a beeper that you listen for you'll get good life out of a
battery and run less risk of the battery being flat just when you want
to go find the beast. Since the roaming range is fairly limited the
audible range shouldn't pose a problem.

Cheers.

Ken

> CB amps are illegal to market

OK. I'll just keep my TS-250, 2 TS-667V's, a Super Star 250
and some off brand "225" with 2 455's in it.

And an RCI 2950 that covers 26 to 32 MHz.

My current collection includes, 13 CB's,
2 IC-2100's that will transmit 136 to 174,
an HTX-420 dual band HT that covers 420 to

470 and 3 FRS radios.

> slapnutz.

Run out of intelligent things to say?
Oh, that's right, you never had any in the first place!

Hi all,

need your help to mod an old ICOM IC-28H. The rig is an US version
with 5,10,15 etc. tuning step. I need to change this to 12,5 kHz.
Unfortunately I have no service manual.

I gus just some jumpers or diodes need to be changed.

Any clue please? Thanks in advance!

73

I recently bought a new Kenwood TM-G707A dual band radio for the car, and found the free Kenwood memory program. I already have the Yaesu ADMS software and cable for my old FT-50R and I also have the ICOM programming cable for my IC-F420 440 radio. I really don't want to buy another cable if one of these cables will work with the Kenwood. So, two questions:
1) Will either of these cables work with the Kenwood (is the electronics in the DB-9 compatible)?
2) If so, the Kenwood uses an 8 pin DIN connector. Both the Yaesu and the Icom only use 2 wires, one for data and the other for ground with appropriate adapters. I assume the Kenwood is the same. If either of these cables will work, does anyone know the pinout on the DIN connector so that I can fashion an adapter? Any info on the net that addresses this? I found lots of info on ICOM/Yaesu, but none regarding ICOM/YAESU to Kenwood.

Thanks...

I have looked at numerous logging programs over the past week. Some freeware, some not-so-freeware. I thought I had settled on a pretty good piece of freeware. But you couldn't save your work on a separate disk. (No names will be mentioned cuz you ain't suppose to look a gift horse in the mouth.) But what I'm looking for is a simple logging program, that can SAVE your work on a separate disk, CD, DVD, etc. My

son was fooling around with the above mentioned logging program, and
lost many years worth of QSO's trying various ways to "save" my info
from the log. It would be nice if someone had a SAVE feature. 73, Bill

An initial check of my info did not show any computer programming info for the Kenwood TM-G707A cable, but I did find pinout info for use of that jack. (you can find that at:

http://www.commtechreview.net/amaradio/g707arev.htm

BTW, you mentioned an 8 pin din.... the TM-G707A uses a 6 pin mini din for both programming and packet.

If you can find the data info you seek, all you will need is a 6 pin mini din and some cable..... or you can buy the mini-din and cable assy for about $16.00. Its the Kenwood PG-5A. I use the Kenwood PG-4S program cable, which is the complete unit for computer interface programming... its about $32.00.

An old mouse cable is great for this, it's also great for packet adapters as well!

Thanks Travis

I've tried that.

I could not get my radio into "Dealer Mode" for some reason. The method described in the documentation simply does not work for some reason. I guess the Dealer Mode is locked somehow.

Programming the radio in the "User Mode" worked OK. Unfortunately the channels cannot be programmed in User Mode.

Any ideas how to get to Dealer Mode?

Regards,
Oleg VK3HOD

You need the Dealer passcode, which unfortunately I do not know.

There might be a good hint on the jpg at H21T-05.jpg right above the
line "DEALER SET MODE".  The handwriting is a bit hard to read but you
could try several combinations and see if any of them work.

Good luck!

Also on the first file H21T-01 (front cover) there is written:

Code 3116 (H21)

Maybe that will do the trick. If so, let us know.

Look at DXkeeper it has several ways to save your files. I have been using
for several years now and backup my files on a regular basis from it.

I have a Icom F3S that my brother sent me and I need to get it
programmed for use on the 2 meter band.  Can anyone help me?  I found a
schematic and made a cloning cable for it, but I do not have the
programming software.  Thanks for your time and consideration on the
this matter.

Sorry, I later realized it is a 6 pin DIN, not 8. Never thought about using an old mouse cable, great suggestion. But the big question remains: Does anyone know if the ICOM/Yaesu programming cable is compatible (I suspect it is). And after looking at the link Ed sent, it appears that pins 1 and 2 are the pins to use (data and ground). The ICOM/Yaesu cables do have level converters built into the DB9 head. I'm sure the Kenwood requires the same sort of interface.

Jim

Here is a one of a kind modular 4CX1000 linear amplifier that will run the legal limit with 15 watts drive. Uses motor driven tank circuit components, with digital readouts on a modular control panel, operated with toggle switches.

Robert, Mark & Travis-

I purchased one of the Titan models (new) on eBay two or three years ago.
I haven't looked recently, but expect they may still be available.

The Titan RPSY-201 has USB, LSB, AM and FM capability. It isn't a very
good radio, but it works. I've used it to check into a local Ten Meter
net, but it is only heard by the nearest stations unless it is connected
to a larger antenna system.

Service data and possible modifications can be found on the web if you
search for similar radios such as the Albrecht AE-201S, Mundara sy-201 and
Cherokee ah-100.

Most of the radios I've looked at use the same electrical-signalling protocol on their data line - basically, pseudo-TTL or CMOS, just as if you were coming right out a UART chip. 5 volt, open-collector / open-drain drivers with a pullup resistor on one side or the other (or both), with the signalling sense being inverted from that of RS-232.

I've successfully used a Yaesu programming interface intended for the VX-5 to program an Icom IC-W32A, although I don't remember whether I needed a custom jumper/adapter to go from the Yaesu's miniplug to the Icom's minijack.

I believe I've seen _some_ radios which use a three-wire (ground, send-data, receive-data) serial connection, using TTL/CMOS voltages. None of the common bidirectional-data-line serial adapters will work with these, without some extra waving-of-dead-chickens.

My recollection, though, is that the TM-G707A is not one of these. It uses a single data line, and should be electrically compatible with the RS-232-to-5-volt-inverted adapters used by Icom and Yaesu HTs.

The most you _may_ need to do, is to pull one extra pin on the TM-G707A interface to ground or +5 to indicate that you're plugged in a programming adapter. I know that this sort of trick is needed in order to invoke the factory-settings/alignment mode, and I have a vague recollection that it may be needed in order to enable the radio to distinguish between a memory-programming adapter and an external TNC... but I could be wrong about that.

```

I WAS going to try to diagram my Kenwood PG-4S programming cable/circuit,,,, but after I opened up the 26pin connector, I gave up. The tiny PC board inside had more active components on it than I had realized.... all tiny surface mount.   A small 5V regulator IC, possibly another IC (only had 5 pins instead of 8), and 4 or 5 transistors, a diode or two, and a few resistors/caps.

Sorry guys, but I don't have the time at present..

Ed

Another Free Competition!

The Southgate Amateur Radio Club's website now has another free competition running.
This time, we are offering you a chance to win a BHI NEIM1031 Noise Eliminating In-Line Module - absolutely free.

The NEIM1031 Noise Eliminating In-line Module incorporates the latest Digital Signal Processing (DSP) technology to remove unwanted background noise and interference from speech, enabling you to concentrate and listen... �Stress Free�

The NEIM1031 will greatly improve the clarity and intelligibility of speech in a variety of radio communication applications. It is suitable for use with amateur radio equipment, scanning receivers, CB radio, two-way radio, headsets, marine communications, taxi base stations, hands-free car kits, processing of audio tapes and signals, pre-processing for voice control applications

Just answer a very simple question for your chance to win one of these super units.

To increase your chances of winning, you can make an entry every day until the competition closes. Entries are invited from all parts of the world.

To enter the BHI competition, just point your web browsers at:
http://www.southgatearc.org/competitions/bhi.htm

Good Luck!

Richard

Try XMLOG (www.xmlog.com). It is shareware and I have found it very useful
in preparing logs and getting my Paragon II to do the work for me!
You can save your files to other disks easily and if you wish import/export
the logs from/to other
formats.

Regards,

Ed, N5EI

```

I have have read quite few posts recently regarding power poles and I
see they are featured in a article in QST this month..

I have had mixed results. In some cases, I found that replacing a
"wall-wart" with a direct connection using power poles gave less
protection from stray RF. In my case the RF is not so stray.. it is
best described as basic overload coming from one leg of my dipole
which passes right over the shack..

In any it seemed to me that the windings in the wall-wart provided
some isolation that obviously you don't get with a direct connection.

Comments??

Bill, W6WLB

I'm confused. You seem to be comparing apples and oranges.

PowerPoles are a way of connecting a DC source (battery, wall wart, solar panel, switching supply) to a load (radio). They're simply a type of plug.

It's _possible_, I suppose, that if you break an existing hard-wired connection, install a pair of PowerPoles on each end, and reconnect them, that the contact resistance of the PowerPoles might possibly be high enough to make RFI problems more obvious. Frankly, I'm dubious, but I have to allow that it's possible.

When you say you "replace a wall-wart with a direct connection using power poles", you don't say _what_ this "direct connection" is coming from, on the way to your radio. Thus, you aren't giving enough information about the topology (layout) of your power sourcing and distribution system for anyone to help diagnose your problem reliably.

If you've got high levels of RFI on your power wiring, adding some ferrite chokes around the power wires would be a very good idea.

Power Poles have nothing to do with isolation or stray RF. They are
simply very good connectors.

My Omni V (recently purchased) went on the sick list today.

When you go to transmit, output is zero....AND the "S" meter still
shows the receive signals...AND you can fainlty hear the audio from
receive...while you are in transmit.

Has anyone seen this?

Any ideas?

Thanks, MArk

I am looking for a freqency synthesizer in the band 100Mhz-1Ghz very
stable to test quipments over a long period.

I heard that now there are some who are GPS disciplined?
How does it work ?
Which is one do you recommend ?

Phil.

A better place to ask the question is on one of the ten tec lists, e.g.

tentec at contesting.com
or tentec at yahoogroups.com.

Sounds to me as if you are not truly switching to transmit. Are you in PTT
or VOX?
Are you on CW or SSB?

If worse comes to worse, TenTec Service is hard to beat, and unlike some
other companies,
if they still have the parts, they will service your rig.

Regards,
Ed, N5EI

I would look for a standard synthesizer with a separate input for the
time base like many frequency counters have. Then buy a used GPS time
standard receiver with a 10 mhz output to drive the synthesizer.

Would probably be a lot less money than a current, state-of-the-art
synthesizer with it built-in. The HP Z3801A GPS time standard
receiver can be obtained on Ebay for around $300.

Dick

Before you get too far into spending money, you have to decide what
stability and sidebands/phase noise you can deal with. Also, if you
need traceability you have to start with that in your spec.

You can easily sink $500K into a fancy new synthesizer and end up with something that's not good enough for a lot of truly stringent applications.

Alternatively a surplus Z3801A (a few hundred $) + a surplus HP synth (a few hundred $ more) chained to the Z3801A's 10MHz out might do what you need.

The GPS lock gets you to the part per billion in precision. If the few PPM level is good enough you might not need GPS, the OCXO or TCXO that are typically built into the synths of the 80's and 90's may be good enough with a little calibration check-up.

Tim.

Charlie,

Put that beast up and use it... get it up on about 30 feet of mast with 4 radials per band and it will work like gangbusters. 100 watts works as well as a KW on a wire antenna

It works great mounted on a 4' chain link fence. Radials are already there depending on the length of the fence.

I think that you are always going to find something that you do not like from a rig, but because of that i can't say that it is a bad rig. When we talk about of the FT-1000MP MRK V we are talking about one of the few HF rigs that really work. Just look into the biggest DXers, Most Wanted and DX Peditions, and see what they are using. When you add the R.FILTERS to the MRK V the selectivity is great and when the band is crowded on contest weekends you would appreciate having a MRK V fully loaded. Sometimes you need to go into a bad situation of crowded bands and other details that affect communication to see what this piece of equipment is able to do. In good band conditions these features sometime becomes useless and unnoticeable based there is no need to apply them.

There have been recent discussions about the interchangeability of coaxial plugs and sockets, their dimensions and their impedances. But, as usual, the magnitude of the electrical effects is never mentioned. Without numbers nobody knows what they are talking about.

A coaxial connector is a very short length of transmission line but at UHF and microwave frequencies it is an appreciable fraction of a wavelength. When 1/4-wavelength long it has the property of transforming a mismatched termination to another value. When 1/2-wavelength long the input impedance repeats the value of the termination. The SWR on an adjacent line is a function of the input impedance.

What is the effect of using a 75-ohm coaxial connector in a 50-ohm system?

What is the effect of using a length of transmission line of 50-ohms nominal impedance when it is actually 53 ohms?

With mixed values of line Zo at what high frequency does the SWR and reflection loss become excessive?

Program CONNECT.exe calculates the effect of inserting a length of line in a system of different Zo. Differences can be large or small. Line length can be physically very short.

For a given frequency, mismatched Zo's and a velocity factor, input impedance, SWR, reflection coefficient and reflection loss are calculated. (Reflection loss is sometime known as mismatch loss).

The program is worded in terms of a connector mismatch but has other applications.

Input data can be varied in small increments from the keyboard while observing the effects on calculated values. Download CONNECT from website below. It has entertainment, educationaal and practical value. Amuse yourselves!

 In doing some research for someone on the Amderson PowerPole site, I
 came across their claim that with proper crimping, the contact
 resistance is less than the resistance of the wires connected
 thereby.

  Note the phrase "proper crimping".  The vast majority of my
  intermittents, improper contact seating, and similar problems with
  PPs was due to "mickey-mouse" crimps made before I got the proper
  tools (ratchet crimper from West Mountain Radio).  One trip through
  the ratchet crimper solved most if not all of those problems.

I was wondering if anyone knew of any fairly current 2m or 2/440 rigs
that allow programming access to the memories via means OTHER THAN
'cloaning' method?

for example here are a few that i already know of
tm700 tmv7

i am not sure about the most current rigs seems the web sites of the
manuf don't really say

any help is appreciated

>

I suppose as in most cases of sudden death the first things to check are the obvious, i.e. the edge connectors, see if there are any subcircuit fuses that may have blown and look for any signs of an electrical smell or signs of burning.
I'm sure you will have looked at most of the above items Alberto, but it does not hurt to remind one just in case.
Good luck with your task, I do hope it's not a real big problem to resolve.
I had a 'TS 950SDX' (and the 950 original) and loved them both, more so the 'SDX' of course.
All the best, Ken, G4KIR.

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.ourmedia.org/node/168474

Topics discussed in SolderSmoke #16:

--EMRFD on mixers and balanced mixers
--LTSpice model for NE602
--Low output from NE602 Bal Mod circuit
--Desitin, diaper rash, and heat sinks
--REVVER web site and Trivial Electric Motor
--Solder smoke in space
--The Simpsons on social skills of Radio Shack customers (us!)

Listen at: http://www.ourmedia.org/node/168474

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod? Wouldn't you like to be able to carry with you the kinds of ham radio conversations that you listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/node/168474

Here's the homepage for our show. All our programs area available here. There is also a blog and links to some of the sites and documents we've been discussing: http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

73 from London

```

What's inside those $5 noise filters for cars that suppress alternator
and spark plug noise?  I would like to homebrew the best and smallest
one practicable.  See, e.g.:

The TS-440S has a simular problem...most all have had to go to the shop for repairs....has to do with removing the goop from the PLL board, and re-aligning. It seems that over time the goop becomes conductive and causes the loss of PLL lock.
This is not something to be attempted unless you have some serious patience, a couple of dental picks, a large magnifying glass, and a lot of time on your hands.
But then I could be wrong.....your milage may vary

What kind of 12amp choke can they put in there when the whole thing
costs $4?

More importantly, what ferrite toroid material and how many windings
should I use for my choke? It would appear that 4700 uF is often used
for the caps.

Nope went to that site and as usual spent half and hour and nothing
on AZDEN Mikes nor even AZDEN itself.   This is usually the result
I get when searching for something but thanks for the useless
pointer anyway.

I have a TR-751 2m allmode mobile and when power is first applied you'll hear about 1 second of USB "hiss" which fades into squelch. Turning the squelch control does nothing at that poin, it's all squelched. Strong signals are heard, so I know the RX is okay. Using a dowloaded copy of the service manual I tried a few things, and while adjusting VR14 "Tight Squelch" I accidently also touched the chassis (thus it was grounded). Squelch went away and hiss was normal. Unfortunetely, the schematic is blurry so I can't trace (or for that matter, even FIND VR14). I was thinking it might be a capacitor, which would account for the hiss and quick fade into squelch, but with the blurry schematic - forget it. So, does anyone have any idea if it's okay to just permanently ground VR14? I realize I won't have squelch for FM, but I only bought the rig for 2m SSB.
TIA
Woody

How many of those pins on that connector are actually in use??(not just has
a wire attached to it)

My own view:  we all work so hard, we don't have time for "casual
shopping".  It's more like 'surgical strike" shopping.  Park, go in and
buy something, get out and go home (or to the next destination: fast
food?).  Thus, malls are on the downturn and single stores clustered in
  strip malls now seem to dominate.
No time to just shop...destination objective reached, egress and head home.
```

Our economy is based upon significant consumption...I think we're entering a new era where time management is at odds with consumption (and spendable income is decreasing)...Americans are working harder and longer, yet their income is stagnant or decreasing.
CEO's excepted.

watch out retailers and consumers!

Hi, Thanks for reading.
Can anyone provide me with a photocopy of the user manual for a JVC VX-610GB VHF/UHF Portable colour TV Monitor. I have just bought on Ebay, but does not have a manual.

I will pay for any postage and photocopy costs

Thanks
Robert
roberttrussler@btinternet.com

I have seen over the years a list of serial numbers for the 440/940/950 series rigs that were effected by Crook Potting material. KW should be able to forward that info as it was common banter back in the early 90's
there was a repair tech in Manilla in early 90's had 14 440's on the shelf ,
all same prob, didn't like high humidity once it started to track

rgds

Does anyone have an easy solution to the following problem?

ICOM IC-740 10m-160m 100 Watt HF Transceiver. NOT IN WORKING ORDER. the radio powered up as it should, with the analog meter lighting and reacting to incoming signals, and the large, bright LED frequency display looked great. The large dial WAS rotating through frequencies, the frequency band switch WAS switching, the squelch WAS working and the radio WAS receiving and sounding great BUT it IS NO LONGER WORKING AS IT SHOULD. As soon as I turn the radio on, it shuts itself off. I see the lights and hear sound for about half a second and then the power just dies. When I turn the on/off switch off, then repower up, it comes on again for a split second.

Thanks very much,
Don, WB3DNF

Lots of places on the web that have service manuals for your radio. Even the basic owners manual for the radio should have the mic pin-outs.

I had one with the same problem. I have since picked up another one that is in mint condition (I do like these rigs).

Anyway, the cheap, cheap, cheap (read junk) pots that Kenwood chose to use for the volume and squelch controls have a tendency to vaporize over the years. What you will find is that the center wiper is probably not making contact with the resistance material.

A good way to confirm this is to hardwire (with a jumper) the center wiper of the pot to either end of that pot. One position will give full squelch while the other will give open squelch. I do have an extra 751 main board so if you figure out which part you toasted I can send you that part.

Don't feel bad..........I went through the same thing with my parts unit before it became a parts unit. The thing that fooled me was that the squelch pot is on the front section of that concentric volume/squelch pot.

The rig was in pretty rough shape cosmetically, so it wasn't a great loss

```
when I scrapped it.

Pete

I have just posted the following manuals for auction to ebay under phiscock3sct. All manuals are in good to excellent condition and starting bid is $2.

Dumont 248 oscilloscope.
Dumont 304a oscilloscope.
EA analog computer eai-tr-20
Fluke8000A voltmeter
Heathkit analog computer.
Heathkit grid dip meter gb-1b
HP 1200a oscilloscope
HP 1801 vertical amplifier
HP 1821a timebase
HP 3310a function generator
HP 5221 electronic counter
Khrohn-Hite 5100b function generator
Philips PM2522 voltmeter
Philips PM3110 oscilloscope
Philips PM3230 oscilloscope
Philips PM3410 sampling oscilloscope
Philips PM6507 curve tracer
Tektronix 2b67 timebase plugin
Tektronix 3a1 vertical amplifier plugin
Tektronix 3a6 vertical amplifier plugin
Tektronix 3c66 carrier amplifier plugin
Tektronix 511a oscilloscope
Tektronix 564b storage scope

Tektronix 564 storage scope
Tektronix 575 curve tracer
Weston catalog and technical description of moving coil instruments

Hello!
It seems I have been put into an unsual position. An amateur radio operator who's something of a noob when it comes to computers wants me to setup the NOS (KA9Q and descendants) package to be a server for both TNC hardware, and to accept dialed connections from the outside. Typically the whole setup would work as a repeater working unattended. I can setup the networking software, I've done it
seven or eight times.

But can it be used the same as say a BBS program back when those were popular were? And the funny part is that he's going to be using a Palm Pilot Vx most of the

```
time to do that function.

FS New Eimac 4X150A Tube.This one has a date code of 4  58. It show some
tarnish from age, but it is still sealed in its original plastic bag. Price
is $35.
I also have a RCA 833A tube with a date code of  4 57 for sale for $65. I
don't believe that it has ever
been used. It looks brand new. Both tubes are guaranteed to be good.
 Thanks, Charlie Hugg, K5MBX

>>> How many of those pins on that connector are actually in use??(not just
>>> has
>>> a wire attached to it)
>>
>> Went looking for a pinout of that connector... no luck yet.
>
> Lots of places on the web that have service manuals for your radio. Even the
> basic owners manual for the radio should have the mic pin-outs.
>
>
>

Well I think all the pins are doing something.   Its got a touchtone
pad on the back of the mike itself, its got a scan band button, a
fav chnl button, an up/down button, a ptt button of course,
and a priority chnl button.   Its not that I could'nt wire up a new
mike plug myself with a ledo lamp I can see well enuff, its obtaining
a 16 (receptacle pins) connector that is hard to find. No one locally
has such a plug.
                     Joe
P.S. The bronze or whatever material that forms the pin feceptacles
  have lose their springiness so I keep bushing them back together with
a tiny screw driver, and spraying them with DEOXIT for good contact,
but the darned things again spread and stay spread no matter how I
try get them to cooperate after a few times of useing the radio I
start the process all over again. I suppose all the mikes and
cords for that old trusty PCS3000 fixed stn rig are in a garbage
dump tomewhere.

K7SAM - Sam

My friend Johann (N5CST) needs some help. He loaned a fellow ham his software for his slow scan station and the other ham did not return it. Johann forgot who he gave the software to so now he can not get on SSTV. The software is:

AVT 308i from Black Belt Systems
This is for his Amiga computer (that is the problem).

If someone can make a copy of the software for Johann, he would be most appreciative.

Hi everyone,
I have come across mention on the web of 10m handheld rigs much like the one
you get for CB, the names Alan and Albrecht come to mind.
They sound interesting, doers anyone know anything about such handhelds
Are they FM & SSB or just FM.
Were they just 10m HAM or CB also?
Were they any good?
Where can tyhey be gottten? I have searched the web and apart from a few
amateur home pages, I have not come across anyone selling them.

Any information?

There were just a few models of these 10m handhelds, sold under different names including Eagle Spitfire and Titan. AFAIK they are NLA. You see them on eBay from time to time for $125 - $200 (USD); some non-US sites also may have them still available.

Try and get in touch with Ben Williams, AA7AS.

He worked for Black Belt Systems back in the early '90s and might have a
copy in his files.

>Does anyone have an easy solution to the following problem?
>
>ICOM IC-740 10m-160m 100 Watt HF Transceiver. NOT IN WORKING ORDER. the radio powered up as it should, with the analog meter lighting and reacting to incoming signals, and the large, bright LED frequency display looked great. The large dial WAS rotating through frequencies, the frequency band switch WAS switching, the squelch WAS working and the radio WAS receiving and sounding great BUT it IS NO LONGER WORKING AS IT SHOULD. As soon as I turn the radio on, it shuts itself off. I see the lights and hear sound for about half a second and then the power just dies. When I turn the on/off switch off, then repower up, it comes on again for a split second.

Hi All

I am having a problem with my Kenwood 732a....I stopped working and would not power on, their was power going to the radio but it would not turn on.

I keep on trying to turn it on by repeating the on off button and now I have a small number 44 showing in the left side of the display and when you push any of the buttons all it does is beep, and now the on off button won't turn the radio off.

Any Ideas Don VE3ULF

Does the 732 have a removable head? A couple years ago my 733 did what you describe so I took off the removable head and cleaned the contacts on the head and the rf deck then put it back and it worked

```
fine.

Yes it does have a removable head and that is how I have it hooked  up via a
extension cable to the radio .

HI, I have 2 733's and it screws up pretty much the same way every few
months.
Take the head off and rub the contacts on the head part and the radio part.
BE CAREFUL, don't break off the pins on the head. I have never had to
clean the
plug on end of the cable to the radio, just the head and the remote bracket.
Good luck... 73

First get an electrician to check your shorts. :-\

Then clean the contacts on the jumper to the face, and then do a
microprocessor hard re-set.

I'm looking for the following ARC5 transmitter parts:

- Antenna binding post ass'y (need two of these)
- Relay (the one underneath the chassis)
- Ceramic end plate for mounting roller coil
- Window with calibrations (clear part only)

I'm restoring a BC-459-A (7.0 - 9.1 mc) but these are
generic parts that can come from any ARC5-type xmtr.

73,
Dean K5DH

Hi,

Can anyone help with information about programming ICOM H21T handheld?

The radio is programmable via keyboard and probably via computer.
I guess it is similar to IC-H16/U16 or IC-H10/U10.

I have tried to program it using "technician code" for H16 but it did not work.

Any ideas/suggestions?

Thanks.

In article <57bav1p4k8f631vealjognqtu5d1pvro2b@4ax.com>,

 They have a VHF receiver that is listed as a 2 meter
> amateur receiver but is tunable to any 5 mHz section between 130 and
> 180 mHz so it should work. Cost is under $50 - of course you can also
> find pre-built weather radios for less but then you miss the fun of
> assembling the kit.

Several models of Sony Walkman have WB reception, including a $30 model.
The problem with them is thy use the same bandwidth as they do for FM
broadcast reception, but will work if NOAA signal is strong.

My friend Stew, WB6EYS asked me to make theis posting for him. He has a Yaesu FT-767GX with a problem with PLL2 on the "local board" (FEX-767-2). The service manual doesn't provide voltages and RF signal levels on the board; no levels in or out of PLL-2 Mixer IC. Stew is looking for RF & DC voltage levels. The chip is getting 15 mhz from the reference crystal. What is the other freq supposed to be and at what level?

Do any of you have this info or know where it can be obtained? Apparently the Yaesu folks can't help.

Or if anyone has a parts radio with a board for sale, or even a loaner he can use to make measurements and return, that would be helpful.

If you can help, send Stew an email. His email address is his callsign @juno.com

Thanks,

Roger K6XQ

Don-

Go to http://www.mods.dk/ and click on Kenwood on the left side of the screen. When that comes up, click on Manuals at the top of the right side of the screen. Scroll down to "TH-D7A-E Adjustement manual.zip". It may have what you need.

RF Concepts RFC 2-417 2-meter linear amp. Input power just right for a Yaesu FT-847 and most mobile radios: - 45 watts in, 170 watts out on 144-148 MHz. - Works for AM/FM/SSB/CW. - Switchable GaAs FET preamp. - Has RF sensing keying. - Switch for SSB vs. FM RF sensing keying. - Has connector for external PTT connection. External PTT jumper selectable "+" keying or "ground" keying. - 5-pin DIN connector for remote control. - Automatic thermal shutoff. - Automatic shutoff when SWR > 3:1. - Indicator LED's for power, TX and protective shutoff. - Includes "Jones" connector for power. - Includes "L" brackets to mount under shelf. Amp is in very good condition, dusty from sitting around. $175 shipped to lower 48 states.

Ahhhh....I see, you had a serious case of the "dumb shits". I did that once,
but not quite to that extent.... I kept the basic rigs and some wire
antennas, a power supply.... just the bare bones station to get on the air
in an emergency. I had gotten rid of all my packet stuff, tower, antennas,
SB200, a couple of spare 2m and dual band rigs and handies.... then there
was all the stuff in the junk boxes.... that was the worst part of it.

Apparently in Radio Shack's case, they don't even care whether their
CEO's even went to college. The just-fired CEO lied on his
resume...instead of the standard MBA, he received a ThG (whatever that
is) after 3 years in some institution.

A theology degree.

Say hallelujah!

john

Tandy Leather in Texas bought the name from them and
the rest, as they say, is history.

Because some of the freqs. above ch 40 are military. We had a kook out here who was ripping up for three years telling the FCC to FO his doorstep and telling them they had no authority to fine him some $50K or more, but he strayed onto Military frequencies and within two weeks the FBI raided his place and trucked him and his stuff away. Looks like they will be selling his house to pay for it all.

I have a list of the frequencies used by the gov, and I stay off of them.

Hi ken. Can you explain a bit more. What kind of software do I need.
what modulation does the VMS use. FSK? PSK? GMSK?

What is the baud rate/bps used. Maybe only one, standard, used
   on Inmarsat?
```

How are the packets constructed. Protocol specification
will be needed. Sync, frame & block lengths, checksums etc?

My main "Junk box" is 30' * 40', and the other one is 18' * 28'. ;-)

I agree. I was a broadcast engineer for AFRTS in the early '70s. Even though everything was considered "Depot level only", I kept our AM radio and VHF TV stations on the air with what parts I could get through the supply channels, and what I could scrounge from junk TVs and other available electronics. I don't think there was a Radio Shack within a day's drive, and the parts house in Fairbanks carried TV repair parts. I even made a replacement tuner for our off air "Demod" used to monitor over the air video and audio from parts of a junked Motorola portable TV set. I got a promotion and a letter of commendation for my efforts.

I will miss them if they go away altogether.
I remember when I was 13 living in Columbus Ohio. If I could get a ride downtown it would only be on Saturday morning. Some of the Radio-Electronics Stores were not interested in selling a kid anything.

IBM was five years behind Radio Shack with the PC. Some of the RS folks are technical, some are not. I have always found them willing to work with me. I hope for a restructure that keeps the parts available.

Parts??? Your RS has parts?? The RS stores around here are doing good to
carry a switch or knob.

Hi all,

I'm trying to contact either Ron Kelly or Ron Hensley, both of whom worked at Cushman Electronics some years back. If anyone has contact information regarding these gentlemen I would appreciate it.

Thanks,

RoD

Your profound ignorance is showing.  With a good virus scanner integrated
into your news reader, the malware is identified and blocked before it can
do any harm.

There's never any need to "open" it, newbie.

I have for sale a nice Kenwood 599D Receiver. It looks good and works good
in AM, but not
in CW or SSB. I can provide pictures to those interested. It comes with a
copy of the manual.
Price is $150 shipped to lower 48.
Thanks, Charlie Hugg, K5MBX

Long shot: give the guys at Triton Electronics a call, the company was formed
by ex Cushman employees. They may have a lead?

Pete

Newbie? That's almost funny. Not all news servers leave infected attachments on messages. Also I have Java and Javascripting turned off in my news reader.

On the other hand, if anyone on this group knows anything about profound ignorance...

A switch or knob?   Phooey! The last time I was in a RS a couple months ago...
I wanted a rubber foot for a power supply (not the stick on ones... a set of feet with 4 screws) they said I should ask at a Lowe's or Home Depot.

RS used to have construction boxes and the works. Now all you see are
TV's Satellite and cell phone and tunes contracts.
Last year they fell short of having cleaner for switch contacts...
I guess that went with the tubes and the old mechanical TV tuners.
Sorry dating myself a bit LOL   RIP   RS
They also recently failed on a simple 4 prong spade lugs power connector.
If they go down the toilet,,, it isn't because Hams have let them down.
We all still go to RS and wish I think.
This last months QST had a project that built a portable mast into
a bucket of cement... all parts from Home Depot... Suppose RS has
give up masts too in favor of Sat' contracts.

   Why do they have to be located in a mall?  Sure, there is a lot of
foot traffic, but the rent is high, its usually a a long walk from
wherever you can find to park, which takes more time to get to the
store, find what you need, and get out of the place.  It doesn't make
sense to me.  The older stores that were somewhere near a mall or large
shopping center always seemed to have more people than the stores in the
malls.

Because that is the "ideal" model of modern mass-market
retailing.  If that model doesn't fit your business, then change
your business to fit the model.

Fortunately, my company is built on giving my customers top quality service and a top quality product and does not fit the modern retail concepts. I guess thats so I don't end up the same way as RS. FWIW, I have been in business for 10 years. Even though the economy has supposedly been in the dumper for the last couple of years, you couldn't tell that from my books. A lot of people are getting a little fed up with the big box stores and their lack of service. "Mass-market" retailing isn't all that its cracked up to be. You might could save a few bucks, but when it comes time to service, repair, or install..... well.... lets just say that soon they are going to have to outsource those tasks to India... the service calls and milage charges are gonna be a killer when that happens.

The key word being "supposedly". Alas, the mainstream media has failed us in accurately and impartially reporting news about practically anything, the economy included. Most of us are equally puzzled when trying to correlate first-hand experience with what the MSM is trying to tell us.

I've read that traditional malls are on their way out. Our local one is
half-empty, while stand-alone stores are springing up all over the place.

Wow.  Dave Edwards' pristine HP1726 275MHz scope is at $26 right now,
and this 5MHz unbuilt Heathkit is at $169?  Guess it must have some
antique/nostalgia value to someone.  It will be interesting to me to
check back in 9 days when both auctions end to see what each went for.

Hi everybody. My TS-950SDX has suddenly died. Powering it on, only the S-meter and the small ticks from 0 to 1000 under the frequency display do light up. No other indication on the display. Pressing any buttons does not produce any reaction.
I opened the rig, checked the backup battery, and it still is at 3V. Clipped an oscilloscope probe to the address and data pins of the CPU on the Digital board, and there is activity. The crystal of the CPU oscillates fine.
I even removed the EPROM (a 27c512), read its contents with an eprom programmer and compared it against the image of another eprom I knew was good. They were identical.

All the symptoms indicate that the Digital board is unable to control the rest of the radio.
I have the Service Manual, but frankly I am stuck... don't know what to check next. If anybody of you is knowledgeable about fixing this rig, please help me. I like this radio very much, and would hate having to depart from it... thanks in advance.

Hi all, posting this for a friend. Ends Friday around 6:00PM EST

Lafayette HA-600A is a ham / shortwave radio fron the early 1970's.
This one is super clean and great working.
Take a look if you like.

There is something about unbuilt Heathkits. Some people collect them, and never build them. Weird.   Then again I know people who collect Barbie dolls and never open the packages, just leave them on a shelf to collect dust.

Thanks for reading this. MY TH-D7 is off frequency by about 1 khz on 2M and
2.5 khz on 440. I suspect that all it needs is an adjustment to the
reference oscillator. I have the equipment and skills to make the adjustment
but do not know where the adjustment is located. Could anyone who has a
service manual help me by pointing out where the adjustment is ??
I've sent this same request to Kenwood twice now and they just ignore it
after reading the email without even the courtesy of a reply.

Thanks in advance for any assistance you can render.
73,
Don

NOW AVAILABLE ** New Program "OPANGLE3.exe"

Choose and set plate current operating angle for Class-B and Class-C RF power amplifiers.

Input data includes control-grid plate-current cut-off volts, DC negative grid bias, and peak grid drive volts.

Advice on how to use Tube Operating Characteristic Curves is included. For interest the plate current harmonic content is computed up to the 21st harmonic.

For given DC plate supply volts and peak plate signal volts, the DC power input, tuned load resistance, RF power output, plate dissipation and efficiency are computed.

This is a repeat of program Op_Angle (now withdrawn) with the addition of an analysis of conditions in the plate circuit.

Program size = 50 kilo-bytes.
Download OPANGLE3 from website below.

Technically, defefred sales tax.   You are supposed to declare such
things on your state tax return where it is called a use tax.  I'm
sure all Californians do just that :-)

Retired, Relaxing, and Relieved... NO TAX FOR ME....
If the Gov't likes to put me in jail for taxes... they can pony up the over
$600 a month I shuck out for meds.   nearly half my SS check.
Maybe soon they will get it all.  Then I can come back and haunt them
when I am gone LOL

Ok no URL... assume is com eh    thanks never looked there yet.
Was considering same rig but haven't sorted out what is really needed
to run the dang thing.   I have worked 10m DXCC on 100 W so no
need for the power brick to upset neighbors lol.
No antennas here yet. Restart after several
years lost in the real world.... ?  no crystals?  hmmm   Thanks

Hi all,  posting this for a friend.

Lafayette HA-600A  is a ham / shortwave radio fron the early 1970's.
This one is super clean and great working.
Take a look if you like.

Interesting to hear all these comments about a company the US government has provided valuable assistance from. While stationed overseas in Belgium, I worked as a radio operator. One of the radio's we used was a Collins KWM2-A transciever and it blew a tube and resistor on a vital communications link. Within 15 minutes, a new one was acquired at a local Tandy store and up and running. Our maintenance chief owes his Air Force Commendation Medal and a great deal of thanks to them.

With all due respect Sir, I happy your boss got a gold plated "attaboy", but I can't believe that your incident has happened in the last 5 years. If you walk into a RS store in these parts(south Mississippi) and ask for a tube, they will look at you like you are nuts.... then ask "A tube of what??". Their employees are clueless if its not in the latest sale flier or the catalog. Just in the last couple of weeks, I was looking for simple, basic porcelin or glass "dog bone" insulators to build a counterpoise for a verticle HF antenna. I walked in there with a picture of a couple of different styles of insulators and they were totally baffled.... never heard of them before, and never seen such. I got the same response from 4 (count'em FOUR) RS stores.

Yes, that was back when they had BOTH...
1) Good help (folk who knew a resistor from their elbow)
2) Actual corporate cognizance of what the electronics business is. In the last few years, it seems to me that the management in Texas doesn't know (or care) whether they are in the electronics business, or selling fried chicken or furniture.

Interesting to see the rise and fall in my lifetime. As a teenager in high school, I remember Radio Shack taking over several of the local electronics stores in town (Orange County, CA). To be sure, the ~schlock 5 resistors in a plastic bag on a peg type places, not the really serious

electronics suppliers. RS never really had a "Golden
Era" IMHO, but they made it to Bronze there for a while.

They started going downhill when some management "genius" decided they
wanted to meet the needs of a different clientele. They carried out his
policy by moving circuit components to the back of the store and brought in
new stocks of radio controlled cars, cell phones and TV/stereos in the front
of the store. See
http://www.forbes.com/business/2006/02/17/radioshack-edmondson-retail_cx_tr_0217radioshack.html
for info on their CEO David Edmonson

I am looking for all filters for an omni V or Omni VI.

Specifically looking for 250/500/1.8 for both i.f. frequencies.

Model 218/219/282/285/288.

Inrad alternates ok, too.

Let me know what you have and price please. I CAN do Paypal.

Please contact me direct at My callsign @ yahoo.com.

Thanks.

K8VF

It might be worth posting on the Ten-Tec list. People buy and sell filters on that list almost every day. See
http://lists.contesting.com/mailman/listinfo/tentec

US companies (*perhaps* companies in other countries too, but probably
to a lesser extent) don't care whether their CEOs know anything about
their particular products or services. Someone can go from a fast-food
co. to a computer co., to an automobile manufacturer, to a health-care
corporation, all the while knowing very little about the specifics of
the industry and getting a salary and benefits many times (hundreds of
times?) more than the CEO of a European company who actually has a
degree in electrical engineering or whatever is relevant to the
company's products.

Your maintenance chief did not have a spare tube and resistor on hand
for a "vital communications link"? Had I been his superior, he would
have gotten something far different than a Commendation Medal!

Mr Bill

Ref Radio Shack. does anybody on here remember the 1st Radio shack??
The one called "Boston Radio Shack". It was the only one in the
country and it was the original one. I was told the new Radio shack
bought out the rights to the title.   The old Boston Radio Shack was
truly a hams delight back in the late 30's.
They had Catalogs available for a postage stamp too something
present day Radio Shacks no longer offer.
                           Joe

Folks times have changed -- todays youth could care less about RF, SWL, Ham
Radio, homebrew, experimenting.
To keep solvent, RS has catered to what sells -- cellphones, IPOD/MP3, toys,
some Audio and TV etc.
The demand for parts, tubes, antenna parts etc has fallen to zilch.
As far as the clerks -- minimum wage.
I have always sed - "don't expect a EE answer from a $5.00 an hour clerk"
Bless their hearts - some of the clerks really try hard and quickly learn
about the products

And I talked with a RS store manager -- the lease rates for store space is
out of site and some landlords want a percentage of the profits !!!
No wonder mail order parts is about all that is left
--
CL -- I doubt, therefore I might be !

FS A nice Kenwood TS-820S. This is the one with digital readout. The transceiver has been stored for
around 10 years and not been used a lot. It is from an estate. It looks and works great. It has full output from the original tubes. It would be near perfect except that the plastic extension for the Noise Blanker toggle switch has come off. This is a push on type extension and can be easily replaced. The NB switch can be operated like it is. The original manual is included along with the AC Power Plug. Price is $345. Thanks, Charlie Hugg, K5MBX

I have the following Kenwood Accessories for sale:
1.SP-820 Speaker with filters. Works great. Looks good, few small scratches. Price is $75;

2.SP-520 Speaker. Works great. Looks good, few small scratches. Price is
$55;
3.SM-220 Scope with BS-8 Pan Adaptor. Works and looks good. With Manual.
Price is $350;
4.MC-50 Mic. Works and looks great. Price is $55.
5.AT-200 Antenna Tuner. This tuner needs some work. The link between the
R-Tune Capactor and the Front Knob needs replacing and two of the toggle
swithces are loose and will need some work.
Otherwise it is working and complete. Price is $55.
Shipping not included. Actual cost only. Thanks, Charlie Hugg, K5MBX

It was still a great place to shop in the late 40's and early 50's. Lots of surplus on the ground level and then I think the ham stuff was on the mezzanine. Somewhere in the early 50's, I remember seeing ads for the Cosmophone desktop kw/receiver. I wonder if any of them actually were sold.

This Yaesu YO-100 Monitor Scope is in good condition with a strong trace and
no burn marks on the CRT. It does have a few scratches on the top of the
cabinet. Front panel is great. Comes with the original manual. $175.00 plus
actual UPS shipping (14 pounds) charges and insurance.
Thanks, Charlie Hugg, K5MBX

Caveat Lector this is for you buddy.   If you think ham radio
and MARS/AARS/Marine Mars is out of the picture nowadays I suggest
maybe you had your head in the outhouse hole in the board.
WW2 was actually fought by COMMS guys of all kinds mostly
hams. Its still being done today in IRAQ and Afganistan
and its those same hams and descendants of Hams that are
doing the job both in the military and in the Volunteer hams
such as I am one of. So think twice before you rave on.
I have a QCWA certificate showing continuous service for 70
years as a licensed ham. So cut out the snootty attitude!
                      Joe/KH6JF
P.S. I dont have a cell phone and never will.   I dont have
cable tv and never will.   I dont have a VISTA computer
on the internet and never will.   I used my head and stick with
my old Commodore 128 which is totally imune to any virus ever
created or could be created in the future. Its my internet machine
and will remain so for that reason. I have 4 laptops which I enjoy
for listening to my favorits music while I play Solitare!!
Hence I dont pay for constant upgrades of virus software every
few months either.

```

Heh!! What make you think it is only the CEO's?
This last year before Mom passed away I had to go to a
drugstore (where they are SUPPOSE to be educated)
and it took 4 trips to get one prescription filled correctly. I find the
same incompetence at nearly every turn of the consumer
trail. I am not even sure they require a reading and
writing skill anymore. If you guess you way through all
the "computer applications" the stores have, your in.
Stores with workers wearing "How may I help you" on
their work clothes and then rush past you like you

were not even there.   Ok.... let me see if this spell
checker works.....

Well bless your head in the sand attitude!!!
I hope the terrorists don't find your long/lat location on a
terraserver and getcha. They have all of it on there except
Area 51 heh   so don't feel too safe. They just haven't
mastered the launch and guidance yet. Oh, I see your
close to the airports.
BTW FWIW   Osama Been Hidin has millions and can
buy all them toys you scoff at... with the software.

Cheers.

My name is Michael. I'm educated as electronic mechanic. I started a project with the goal to receive and decode the VMS signals from Inmarsat. VMS system is manly used on fishing vessels. On the ship there is a box with a gps and satellite transceiver. The
position information is send each hour, to a land earth station, were it is distributed to the different authorities. I hope that many of you will help and contribute to get this working, because I don't have all the skills my self.

First I started to ask people in different news group about the subject. But I now realized that it will be a bigger task. So I have made a Yahoo group to get this thing going. I have in this group posted the information I have gathered until now. If you think you maybe can contribute to the project then, or is interested in this as well, then please join at

http://groups.yahoo.com/group/vms_group

Cheers Michael

hehe asking the question before rigs arrives ? intend to use it with a Hi
Sierra MK2,  rig not here as yet ?
unsure if info is supplied. tricks the 480 into think it has a external
tuner plugged in, hence 10ws cw tx,

Get a Turbo-Tuner... Its really the way to go.... I have the 480HX with a
Turbo-Tuner on a Tarheel M-200 and its really a great set-up.
Its almost completely "plug and play". I have pics posted in the Yahoo
TS-480 group.

But at least the store clerks aren't getting multi-million-dollar
salaries plus additional multi-million-dollar handshakes when it is
found that they don't have a clue how to make the company profitable.

no restrictions that I know of beyond those of any other antenna...length of
feed lines and control cable etc.
What are you going to use for a counterpoise?? Where's it going to be
located??

no worries I was a member before, I will rejoin, I cancelled all groups
subs,
ok well all BIG antennas and BIG AMPS have GONE, everything was rotatable
once, well had a spack attack and a silent protest in rgds the hobby, and
just getting soemthing to have a play with,
counterpoise is a fully tuned radial test bed, 10 radials for each band
the 160/80/40/20 Mtr radials are 1 7/8' x 1/8 " Power Station EARTH MATTING
ROLL, I would have at the very least 12 cwt of copper in the ground, have a
1500MK2 mounted on a 2" ally tube 7ft 6" above gnd, with a 2" x 1/4 " flat
strap to gnd hehehe, with 4 x 24" SS CAP Top hat tig rods, above the coil
with a 3ft whip, still too long to tune above 18Mhz, but working on a happy
medium, still got 4" of coil in the Mast at 3.670 Mhz, with above setup,
should trim the CAP HAT a little,
I should mention I had HS-1000 in my car back , uuhhmm not long after Jim
started making them, would have been numbered in the 100's I was talked out
of it by a friend haahah, some friend caught me at a weak moment back in
2004.
I would have had a TARHEEL but Cindy wanted $275.00 to post to VK, I got a
MK2 1500 posted from VA insured for 400.00 for 75.00 USD, Global express,
42"x5" @13 llbs, 75.00 USD anyhow thats life
I appreciate the info, unsure of what 480 as yet, don't need 200WS and
don't need TUNER ?? ahaha,
need 150ws unit without tuner ahahah
tnxs
dennis vk4sx

very nice setup, your rig
my antenna is about 35mtrs from shack, I don't have any trouble tuning it
now, so the turbo-tuner and the dc supply from the 480 should be Ok ??

I am looking for a schematic and service manual for an Icom IC-821h.

So far, Google has not been my friend. Does anyone know of a source for
these?

Thanks

Paul P
K0PRP

I have a TS-450S (no tuner) and and SGC SG-237 Smartuner. The SGC needs only 8 feet of antenna down to 3.5MHz. I used this setup in my camper, and it did OK. If you're interested, both are currently up for auction on eBay. Sold the camper, and not interested in mobile operation.

You 'only' need to receive the C-band link to the LES, there's no magic
in the data, it's straightforward Inmarsat-C transmission.

Ken

Actually they were adapted from some motorola tech notes.  He wrote the
parts list, the girls built them.  These were full production units until
FCC signal purity regs were instituted.  They were good for heating up
external low pass filters.  Beleive it or not I think the company is still
in business.

Yes he had a cb in his car.  I don't see his call in the dbase any more.
Probably deceased.

hey there,
im pretty keen to start recieving severe weather warnings via marine vhf. just wondering if theres any electronic hacks involving modifying an am/fm radio? im handy with a soldering iron, so im not afraid to get stuck into it.
cheers,
cameron

I'm sure it's possible, but it's not uncomplicated.

The NOAA weather radio frequencies are in the 162 MHz region (162.400 through 162.550). It would be necessary to figure out a way to re-tune a standard FM radio (probably changing both the front-end bandpass tuning and the local-oscillator tuning) to extend the radio's tuning range upwards from its normal limit of around 108 - 110 MHz.

Perhaps more complex is the fact that the NOAA channels use narrow-band FM modulation - the channels are only 25 kHz apart, and so the carrier deviation is probably limited to +/- 12 kHz or so. That's far less than a standard commercial FM station, as these are usually 200 kHz apart and use a much wider carrier deviation.

The difference in modulation has at least three implications. One is that you'll have to adjust a standard FM radio's tuning knob _very_ carefully to get the NOAA channel centered in its bandpass, and the FM automatic-frequency-control circuit may interfere with you. A second is that you'll probably find two or more NOAA transmitters sitting within the receiver's bandpass - you won't be able to tune into one and eliminate adjacent-channel interference from the other(s). A third is that even if you do get the signal down to a single channel, the audio output level will probably be very low due to the narrow deviation of the carrier.

It'd probably be cheaper and easier to find an inexpensive AM/FM/weather radio which has this feature built in, or perhaps to find a specialized kit.

I agree with Dave, and decided to look at Ramsey kits; not the cadillac of the kit's that have been available over the years but workable. They have a VHF receiver that is listed as a 2 meter amateur receiver but is tunable to any 5 mHz section between 130 and 180 mHz so it should work. Cost is under $50 - of course you can also find pre-built weather radios for less but then you miss the fun of assembling the kit.

Agreed! It tastes much like bacon when you fry it. Works well for a camping trip!

Gidday All,
this Posting to advise I have several of these
fantastic High Power (35 Watts minimum Output) Linear Amplifiers
available For Sale.

See my eBay Listing.. simply Search on "1296 Mhz"

Additional information can also be found on my Website as per below.

Questions : Email me direct. I will gladly provide more information.

Cheers & thank you.

Alan - VK3XPD.

It sure came in handy the last couple years right after the hurricanes ripped down power poles and electric lines here in Marion County, Florida. No electricity, roads closed and no stores open so you ate cold canned goods. i have a dozen cans already for this year's hurricane season, along with a couple large jars of peanut butter and several boxes of crackers. It was weeks before the stores had fresh fruit and vegetables, or much of anything else. :(

Can a Heath GD-1B be safely powered from a DC/AC power
inverter? I know the output of most inverters is a bit "dirty" so
I don't want to do it if it will harm my GD-1B.

Sec. 95.411 (CB Rule 11) May I use power amplifiers?
(a) You may not attach the following items (power amplifiers) to your
certificated CB transmitter in any way:
      (1) External radio frequency (RF) power amplifiers (sometimes called
linears or linear amplifiers); or
      (2) Any other devices which, when used with a radio transmitter as a
signal source, are capable
           of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your
authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF power
amplifier if--
      (1) It is in your possession or on your premises; and
      (2) There is other evidence that you have operated your CB station with
more power than allowed by
            CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in
another radio service which allows
      you to operate an external RF power amplifier.

Note that (d) allows Amateurs with HF privileges to posses amplifiers.

I know of no "CB only" amplifiers. I own several intended for CB purchased to use with QRP rigs years ago. All work fine on 10m, most on other ham bands down to 20m. I'd bet the "awesome varmint" does too. One should also use a lo-pass filter to avoid the harmonics these cheap amps are prone to generate.

I rather doubt that doing so would cause damage, as the power supply
is transformer-coupled.

I'd be more concerned about incorrect or flaky operation.  The GD-1B
doesn't appear to have particularly good RF/EMI filtering on its AC
supply... there's just a single-stage R/C on the high-voltage DC and
none on the filament. A stepped-square-wave inverter would probably
end up dumping a lot of HF hash into the circuit.  This might cause
the oscillator/detector to misbehave in any number of ways - the meter
might jump around a lot as you tune, or the oscillator frequency might
"pull" to the frequency of one of the inverter harmonics anytime you
got near it, etc.

You might be able to improve matters by installing a hefty,
high-attenuation RFI/EMI filter (such as the sealed-in-metal modules
sold by Corcom and others) in between the inverter and the GD-1B.
Adding some EMI filter components inside the GD-1B might also help...
ferrite beads on the mains wires, some .01 uF - .1 uF mains-rated
filter capacitors across the primary and secondary transformer
windings, etc.

Thanks, Dave! Lot's of great info. I just bought a mint GD-1B in the
original box with 7 inserts. I understand what freq range the 1st 5
inserts do as they are marked and there is a picture in the manual.
Problem is the last two inserts - they have a lot of wire (looks like
AM antenna micro wire). One has 1 coil of wire, the other 2 coils.

Unlike the regular coils, these are wound inside the plastic form
and sealed. Any idea what they are for? Is that the 341-A coil set?
How do I use them (what range)?

Thanks again....

Ken KG0WX

Hi

I've bought a second hand Kenwood TM241. The problem is that the only sign of live at the front site is the burning DIM led. Further there's nothing burning. All the buttons function well and are beeping alright.

Does anyone know if there is a possible failure or is it possible that the old owner switched of the display in some way, it was used in a cab/taxi.

Hope someone knows a sollution.

Kind regards,

Marco (mkalmijn@yahoo.com)

That sounds like a really nice find! I'd be very interested to learn how you find its sensitivity. There seems to be a big range in dipper output and sensitivity, with most of the modern transistorized units coming up looking rather wimpy compared to classic firebottle types such as the Measurements 59.

>How do I use them (what range)?

That's probably the additional coil set mentioned in the manual (which
you can download from http://bama.sbc.edu or its less-heavily-loaded
mirror site at http://bama.edebris.com/

The standard set of 5 coils goes down to 2 MHz. The manual says that
the extra coils extend the frequency range to 350 kHz, but doesn't say
how many coils are included in the extended range. Since it appears
that each of the coils in the standard set covers a frequency range of
about 2.5:1, I'd guess that one of your extended coils covers from
somewhere around 800 kHz up to 2 MHz, and the other covers from 350
kHz to 800 kHz. The one with more wire, is probably the latter. You'd
use these coils in just the same way that you use the other five.

If you have access to a reasonably sensitive RF frequency counter it
shouldn't be difficult to confirm this. I use an MFJ 269's freq-counter
function, with a few inches of wire soldered to a BNC connector, in
order to do fine calibration of the output of my Measurements 59 grid
dipper. Just plug in the coil, turn on the dipper, hold it near the
frequency-meter wire probe, and the probe will probably pick up enough
RF to give a good indication.

This is what I have been saying. You are not in violation for simply owning
a linear.
 (1) It is in your possession or on your premises; (KEY WORD) and
      (KEY SENTANCE)(2) There is other evidence that you have operated your
CB station with
```

more power than allowed by
CB Rule 10, Sec. 95.410.
So read it and weep people. I may not be able to operate said device but I
can damn sure own one.

Excellent. In my experience, as a general rule, the dippers having
higher output can achieve a usable dip with looser coupling to the
circuit being measured... which means less pulling of the oscillator,
less parasitic loading, and a more accurate measurement overall.

Radio Specialty Model 1179-22-1 Repeater-------------------$ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed, but inside is very clean!
Repeater is in a wall mountable battleship gray cabinet,
that is 4" deep by 13.5" wide, by 21.5" tall, and is
around 30# in weight. It is a VHF base/repeater used by
the BLM out west...
It also has on the front cover, I-5YACC, then under it is
271, under that VHF REPEATER. There are a lot of FCC type
acceptance # all over inside, plus the maker, and maker's
partial address, and part # for transmitter, and receiver
sections.
NO documentation.

1 Comspec TS-32P------------------------------------NEW----$ 35
New never used in original package complete with tuning
tool, wire jumpers, switch chart for pl tone, and mounting
tape plus original documentation/schematic.

2 Kenwood TR-7950-----------------------------------EACH---$ 80
Each comes with mobile mount, and 1st sale gets the
packet adapter. Are in very good shape, but do not include
the TU-79 PL boards which are available at www.piexx.com
They will not come in original box, and if I do not have

the manual, I will photocopy, or pdf one (your choice)...

LinkXcel PS-141B 4 port KVM Switch with 4 cables-----------$ 65

   So, you're saying that you're gay?  Don't tell me that you've never
seen a bunch of them walking down the street on the news chanting that
phrase.

Hi, I have a an old FT747GX, it appeared to have a burnt inductor coil on
the BPF board, and was displaying distorted audio in SSB transmission, I
wound and replaced the inductor, (L12) but Audio is still distorted, and
you can hear parts of the Tx audio thru the speaker,
it has the remote mount head kit,
would appreciate any ideas, and where to look'

A pity, *perhaps*: they still did carry one or two items of use to radio
amateurs, and without requiring a long drive or paying more for shipping
than for the item.

Hey! I just noticed that in the subject line I wrote "Radio SChack"
(note the extra "c"). Perhaps my subconscious was telling me that it's
really "Radio Schlock."

Well I for one can understand partly the reason why. It was nigh
impossible to get a Radio Shack catalog in any way shape or form. This was
and is a big part of why we dont use Radio Shack much any longer.
I managed to get one or 2 old catalogs by asking each Radio Shack
if they had old ones under the counter they could give me.   This
is why I petitioned "Mouser" for a catalog and they put me on their
list so I should be getting an updated catalog every quarter.
Joe

rgds-

It could be as simple as a high SWR, with RF in the shack.

For example, RF energy might be picked up by the speaker cable and coupled back into the speaker audio amplifier. It could be also coupled through the microphone cable.

RF energy can over-drive an audio amplifier so that it amplitude-detects the signal. I can imagine that the "Donald Duck" sound of SSB would appear as distortion in the transmitted audio.

Tnxs for reply Fred, i should have mentioned, I connected gear to a
Dummload, out put is down a little, plus a low level Motor Boat type noise
on AM and CW carrier, SSB tx is still distorted into DL, with MIC gain
increased to get meter deflection, DISTORTION increases with MIC Gain, also
tried a NEW MiC, same deal, something caused the LPF L12 to burn out

Tnxs again

The parts I've bought have been good quality. The alternative is to buy
on the internet from Mouser, DigiKey ect. You will pay postage and
shipping and it will be far less handy. If I need a phono jack or plug
now, I can drive a mile and a half and have it here in 20 minutes. From
a mail order place the shipping will cost more than the part and it will
take several days. I also like their scanners.

I hope they don't close the R/S near me.

I guess I must be blessed as I have a "real" electronics parts house only
about 10 miles away... there are 4 RS stores between here and there. For me
its well worth it to drive the extra miles to get quality parts and
connectors. The last batch of PL-259s I got from RS were all garbage. Every
last one BROKE when screwed down even "finger tight". Their coax is *maybe*
50% shielded.... yeah, real top quality stuff at twice the price of Beldon
RG-8 foam at the "real" supply house. No I don't have a lot of use for RS
anymore.

Hi.
Thanks Rick for the offer.

I will need to tune as low as 2.020Mhz which is 1 of the emergency
frequencies on the system I am using.

The antenna needs to be very robust as it will be used on a 4WD. Codan
and Barrett specialise in this area but it's hard to find just the A/T
antenna!

I'll do some research into the screwdriver antennas and turbo tuner.

MoonRaker does a great antenna. Here is a link for those interested in
a 2-30Mhz auto tune antenna which is less than 9Ft tall!!!

http://www.moonraker.com.au/ftp/at230.pdf

Thanks, Dom

About the one who mentioned the expense of shipping vs Radio Shack
local stores. Dont forget the "sales" taxes in most states can
override that factor.   We call them "Excise" tax in Hawaii and
believe me shipping from USA will be much cheaper than our
Excise taxes specially on the higher priced items.

For sure   Nearly 10% sales tax here in Tenn.

I go to KY for much of my shopping and I plan on buying all my new radio
gear
via catalog OUT OF STATE.   Free shipping most places.

Per eBay:
CB amplifiers: The FCC does not permit the use of power amplifiers with Citizens Band radios. Therefore, eBay prohibits any listings of the following:

* CB amplifiers
* Amplifiers specified for use on the 11 Meter band
* Amplifiers designed for use in frequencies 24 MHz to 35MHz
* Amplifiers posted within the CB category
* CB Radios that are amplified to exceed 4 Watts using the AM Settings or 12 Watts using the SSB settings

```

The question to seek is WHY are they there?

The "courtesy tones" serve a purpose (yes that is a funny name and I don't know where it started, but)...to tell when the timer is reset.
73, Steve, K9DCI

Hey Fred!   dont you want to loud and proud on your amp?

Also, tell what is it your concern what someone sells on this damn newsgrp!

If i want to sell some pot or new meds, that means your gonna go tell the local cops?

Remember now, theres a freedom of speech ethics here.

Carefull what your wishing for, all I say is to watch your back. In these days you can never

be too safe.

and last you think the FCC is going to do anything to fix the crap thats going on the hf bands today?

Hams bands have gone to hell! I say sell them all to highest bidder to commerce, and world use.

and let the "New World Order" take over.

The New World Order is here!

willey.

It's not a ham selling it, it's a no life moron bootlegging the guy's call.

Not sure why he's doing it, must of had a hissy fit over something the other guy posted somewhere. It's an old technique that's useless.

I have been playing around with receiving AIS (Automatic Identification System) signals. AIS is used on ships, it is used to send information about your position, etc via VHF to the surrounding ships. But know this started to get a bit boring. So know I wan to try to se if it is possibly to receive the VMS signals from Inmarsat-C. The VMS system is manly used on fishing vessels. On the ship there is a box with a gps and satellite tranciver. The position information is send each hour, to a land earth station, were it is distributed to the different authorities.

The first thing is to receive the signals. But also to decrypt the data can be complicated.

Any help or advices are welcome. Also if you have some good links to people ho have been dealing with projects like this, could be useful.

Cheers Michael

Hi,
I am looking at purchasing one of these radio. I would like to use it
in the car and I am wondering what the lowest frequency I can tune into
on a mobile antenna. I wouldn't want to go to much bigger than a 7-9
foot whip.

Also, is there any radio which will tune below 7mhz on a 7-9ft (or
smaller) whip? I know Codan make an antenna tuner that will do it.

Thanks, Dom

Use a screwdriver antenna with a Turbo-Tuner...then you can use the 'HX
instead of the 'SAT. That extra 100 watts comes in real handy especially in
the mobile. Talk to the folks at Tarheel antennas.... they did right by me.

Dom-

My TS-480SAT can tune the 40 Meter phone band, but only 1/2 to 2/3 of the
75 Meter phone band using the appropriate Hustler resonator and mast.

You are asking too much of a built-in tuner. The specs of built-in tuners
usally say the antenna must have an SWR of 3:1 maximum. Because of
component values, they may match a wider range on the higher bands, but
not on 75 and 40 Meters.

To do what you want, you should consider N6OJN's suggestion, or look at
one of the separate tuners that companies like Kenwood and Icom have for
their respective equipment. MFJ, LDG and SGC also make external auto
tuners.

I have the first 15 years of Electric Radio from 1989 thru 2003 for sale for
$200. There are a few issues
missing, but most years are complete. Some copies from 2004 and 2005 are
included along with 4 duplicate copies from 91, 93, and 03. Thanks, Charlie

I don't know what he really designed. It appears to be a standard 12 volt amp kludged onto the back of a 12 volt power supply. Of course, he did add some kind of metering, and moved the control switches to the front of the power supply, but if that's designing, I have designed cars, computers, and of course every home I have lived in since I could push a dresser around.

To further this, according to 47CFR95 its illegal to even have a CB
amplifier in your posession.

Spend a couple of bucks, buy Code of Federal Regulations 47, then *read*
part 95, as well as part 97. Then maybe.....

BTW.. the book is available through the US Government Printing Office.

Can he use it when transmitting into his dummy load?

Not a real Bird dummy load but one of them
10,000 W ERP verticals attached to his truck
with the genset trailer to power the entire setup !

Yes, the 10Kw vertical with the tophat that
you find on ebay all the time, hooked up with
rg8 'belden' brand (no markings on coax !)

kyle

New Program   - OP_ANGLE.exe

This program assists with understanding, choosing and setting the operating angles of Class-B and Class-C RF power amplifiers.

The operating angle underlies all performance characteristics.

Although RF operating conditions for tubes can be set up using manufacturers' data sheets, the program refers to use of a tube's Operating Characteristic Curves.

Download program OP_ANGLE in a few seconds from website below. Not zipped up. Run immediately. File size = 39 kilobytes.

The FCC has taken the stance that: "possession is sufficient to prove
guilt".

so, even *if* you don't have one hooked up, you are still in violation of 47
cfr 95 et al while in possession.

I am looking for the CL-33-M-WARC Kit to convert a Mosley CL-33-M to a
CL-33-M WARC so that I can work the WARC Bands on my Mosley Beam. The Kit
must be complete and in good shape and shippable to 79602. Please e-mail
your price and the condition of the kit. Thanks, Charlie Hugg, K5MBX

care then to explain the fines they have issued over the last 10 years or so
to folks that were heard on the air, but were found not to have said
"linears" hooked up? they still got fined.

even though 47 cfr 95 doesn't explicitly state it, if you are caught with an
amp in your possession, you are as guilty as someone who uses one. end of
story.

another concept you should wrap your brain around: "guilt by association".

>tmize57@juno.com

Tim,

The cloning cable has a RS-232 to TTL level converter, hope you built one with the converter. The F3 / F3S will not connect directly to a computer RS-232 port.

The cloning programs are the same. The F3S is a simpler radio, without the DTMF keypad.

I don't have the F3 information at hand but you do need to place the F# into cloning mode, usually by holding down a button while powering up the radio.

When using the program you need to first READ the radio contents into the program. Icom's have hidden data in the radio that you can't input yourself.

Starting the cloning program and trying to reprogram the radio without first   reading   the contents of the radio will cause cloning to fail. The hidden data gets over written with empty numbers.

To fix that see if someone can send you an Icom .icf file for an F3 / F3S. They are the same if the frequency coverage is the same. Load up that .icf and clone the radio, now read the radio back into the program and make your frequency changes. and clone the radio again. Save the modified file as your .icf.

I hope some of this helps

Gary K8IZ

well it would depend greatly on what bands you wished to work mobile
the Icom 208H is a tiny 2/70cm FM rig with detachable face the radio
could fit nearly anywhere
if you wanted HF the Icom 706 would do nicely you could mount the radio
under a seat or in the truck and mount the face somewhere flat and easy
to see
as for antennas the field is wide open depending only on how deep your
pockets are

> Richard,
>
> I also am a Newbee to Ham but I got a Kenwood TH-F6A HT and love it. I'm in the L.A. area so I find 220 more open than 440 but I figure where ever I go I'll all three bands covered with this little HT. I too am looking into an mobile for the truck and/or the home. The Yaeshu FT-8900 dual band or the 8900 quad band looked nice to me. Good luck.

The Yaesu FT-7800R is a great (and inexpensive) dual band mobile rig. It has a removable face that makes it easy to mount just about anywhere. It also has the capability of being programmed from your computer*with the appropriate software and cable). If you do any traveling, you can pre-program one of the memory banks for the repeaters in that area, along with the machines along the way with just a couple of keystrokes. BTW...it has 1000 memory slots avalable :-)
I don't know of any places across the US that don't have some kind of 2m/70cm repeater coverage.

Now on the HF side... This is going to depend on a couple of things.... are you going to be operating primarily from a land based station?? or mobile?? Each has several ways to go depending on budget and real estate.
Try something like a TS-140S or simular....nice starter rig...simple, basic

and will do most anything you want it to do(can be used mobile also). A 20A power supply can be had for a reasonable price. for the antenna(s)... If you have the real estate, wire antennas will work well. With the addition of a tuner, a G5RV is a good starter antenna that will pretty much cover all the HF bands. If you don't have a lot of space, you might look at a verticle...maybe something like the Hustler 5BTV. If you are handy at all, and with the guidence of your Elmer, you can reasonably expect to get a nice, functional HF station on the air for as little as $350 - $400. OTOH.... if you got lots of real estate, and more dollars than sense, you can easily sink more money into a station than a lot of folks make in a year. :-)

I considered both the VX-7R and the TH-F6A, but opted for the latter because of the full power output on 220 (although now in this new location 220 is not used much). My son and I now both have TH-F6As (for uniformity), along with two higher-capacity batteries from W&W Manufacturing (http://www.ww-manufacturing.com) and their drop-in charger that works with those batteries either detached or in place on the rig.

The following manuals were rescued from the trash at my university during a
move. I've given away some to interested parties, these manuals remain. I'm
selling them to ensure that they get a proper home. Cost $2
each plus shipping. Check with me by email to get the shipping cost, which
ranges between $7USD and $12, depending on the size of the manual.

All the manuals are in excellent condition with very few (if any) marks.

Email me if you are interested in any of the following manuals:
--------------------------------------------------------------
Tek 3B3 Vertical Amp Plugin
Tek 561B Scope Mainframe
Tek 545B Oscilloscope
Tek 7623 Storage Oscilloscope
Tek 53/54D Vertical Diff Amp Plugin
Genrad 1650A Bridge
```

These ones are currently listed on Ebay for $2 plus shipping.

Tek 3A74 4 Channel Vertical Amp Plugin
Tek 564B Storage Scope Mainframe
Tek 2B67 Timebase Plugin
Tek 321 Oscillosope
Tek 3A74 Vertical Plugin
Tek 3A8 Op Amp Plugin
Tek 3C66 Carrier Amplifier Plugin
Tek 434 Oscilloscope
Tek 5031 Oscilloscope
Heathkit O-11 Oscilloscope
HP 180A/AR Scope Mainframe
DuMont 224A Oscilloscope
DuMont 304A Oscilloscope

The DuMont manuals will be of interest to oscilloscope history buffs, they are from the 40's and 50's.

I have another box full of manuals, which I'll post in due course.

Thanks -
Peter

Hi Gary, yes I did build a level converter, found the schematic on the net, it was a schematic directly from Icom for the programming cable. I did try holding all the buttons while powering up, didnt notice any difference in the display if it was in the cloning mode, I will try again. Its good to know that the radio's and programs are the same. Sounds like I just need to get the radio into cloning mode and then read its contents. Thanks for your reply and insights, it helped alot!

I am trying to adapt a CB "roger beep" mic for ham radio and there is some odd terminology for CB mic wiring.

The CB'ers call "PTT" "transmit (TX)"

They call "audio-out" "audio" (not too bad)

They have a separate line for "receive (RX)" which some call "receive
control." What is that for? Anyone know? By testing, I know it is
not for a speaker in the mic. It shows 6 ohms to ground.

Tie 1/2 of the wires together, then tie the other half together, then plug

into a wall socket.
That will take care of the problem.

BTW... there was a ham in these parts that put that crap on his mobile ham rig.....one morning he came out to find that his mic and rig had come into contact with a large, high velocity, inertial impact device.

I got the impression it wasn't the computer-connected programming issue, but remembering the "menu-structure" of all the features when using it in the field. He said that (at least for him) the Yaesu was easier to remember the button sequences than the Kenwood.

Hi Ken -- ignore the nasty replies

About Roger Beeps on Ham Radio
Tis highly frowned on
If you use it on a repeater -- sixteen+ Hams will come back and say you have
a roger beep tone
You say yeah I know
They say -- get rid of it - it sounds like CB
No FCC rules against it - but it's considered poor practice
Repeaters have a courtesy tone (beep) so your beep is not necessary

On HF - also frowned on -- if noisy conditions - just say OVER

--
CL -- I doubt, therefore I might be !

I always ignore the crackpots; most have no lives and nothing to say
of value.

Well, NASA uses roger beep with its astronauts and ham repeaters use
them all the time, but call them courtesy tones.  So I see no problem
with experimenting on SSB, especially with folks I know who have no
objection.  Especially if the tone if not loud or extravagant.

Ok... you got 3 replies that all said *don't do it*, and you want to call all 3 "crackpots" and ignore what they have said. Consider the levels of experience you are dealing with. Personally I have been licensed since 1984.

If you absolutely must use a beeper, then do it on the Childrens Band.. not on the HAM bands.

This is an old (circa 1973) video display that was used
with HAL RTTY converters like the ST-6. Pulled mine off
of the shelf after years or storage, and it has problems.
Need schematics (original or copy).

Thanks!

Steve

From a practical standpoint, you aren't going to be doing that much
programming in the field.  Mostly it will be changing power levels and
frequencies.  If most repeater frequencies are programmed in by
computer, all you would ever need to do beyond power and frequency in
the field would be to change the tone freq.  Shouldn't be that hard to
learn to do one thing.  I have had my F6A for a couple of years and
field programming has never been an issue.  If it was, I would be in
trouble.  :-)

Dick

In spite of my agreement with most of the flames thrown at you about this, there are certain applications where "curtesy tone" is warranted - as few as they may be.

So that out of the way, often the RX is used to enable/mute the audio If the RX is pulled low, it enables the audio path to the audio output. If open it will mute.

Hello,

In a decent way, these tones could probably be useful during contests or when propagation conditions are weak (V/U/SHF). But beware, don't abuse it, or you'll be called a Johnny.

73 de F8BOE Olivier ...-.-

I recently purchased a used 703+. I have a question about the ALC. ON 6
meters I have no ALC indication or adjustment on SSB. The radio xmits full
power and sounds fine.
Is this normal?
The ALC is adjustable and works fine on HF SSB.
Thanks
Larry Naumann N0SA

Here is the latest in the garage door opener saga. Edison Co. came to my aunt's house and had her turn off the main power breaker. He then asked her to have the neighbors try their openers. They worked perfectly! The problem seems to have been related to a surge protector she used on her computer system, but I don't know if that's the final answer. Hers does work fine now. I have been trying to figure out how a surge protector not connected to the opener could affect her opener as well as the close neighbors. Must have been putting out one heck of a spurious signal.

Dick

On repeaters the beep is more than a courtesy tone
It also signals that the repeater timer has been reset.

Transmission times are accumulative, if folks don't wait for the beep.
Example: A machine has a 60 second timer and station X talks for 50 seconds,
if station Y comes in before the beep, 10 seconds later the timer will shut
down the repeater. To signal a timer dropout, some repeaters use a voice
announcement, others use a series of short beeps, such as a triple beep.
Others may use a short delay, a short beep and then dropout.

As i said before -- if you use a roger beep on a repeater, a dozen plus guys
will alert you that you have a beep tone and ask you to turn it off
--
CL -- I doubt, therefore I might be !

Very interesting find. Please post any further updates on this. I'd like to know if the problem would transfer to another home if that surge protector is moved to it.... also, might be interesting to put a high frequency scope on the AC line going in,and coming out of that protector to see what is on the 120V inputs and outputs.

Ed

I'm going to see her later this year. I will have her save the surge
protector for me so I can bring it back home for test.

I see no reason to use it in any mode with a carrier; you know when the other guy has released PTT. As I said, I want to try it on SSB where you need an "over" to know PTT has been released. Some hams think you are a lid unless you say "over"; I see no reason to make like a simple machine, unless you have the IQ of a simple machine.

I believe the FRS radios also use a roger beep. They probably outsell ham radios 100:1.

A distinction here is that the repeater itself puts the tone on to
signify when the timer has started. The tone is not superimposed by
the person using the repeater.

There are only a couple of times when transmitted audible tones are
used. One is for a repeater autopatch. The other is to awaken Litz
decoders for emergency traffic. Beyond those two applications,
audible tones have no place in amateur radio. They need to stay in CB
land.

You would be better using the DATA port for PSK31 and similar.
However, the pin out from the FT-847 manual for the mic socket is:

1 Up
2 +5V
3 Down
4 Fast
5 Gnd
6 PTT
7 Mic Gnd
8 Mic

It does not bring out RX audio. You can use the speaker jack for
that.

I may be making too much of this, but this little HT is the greatest - EXCEPT for one thing. It has left me with a dead battery too darn many times, just when it was very undesirable. If I'm involved in doing something else, and waiting on someone to call me, and the battery chooses then to go dead - I never know I missed the call.

That's just one example. It goes dead right in the middle of my transmissions sometimes, WITHOUT WARNING. I find myself with a dead radio when I let up the transmit button, and never know how much of the transmission got sent. Then I have to dash around looking for a charged battery to put in, and hope the guy I was talking with is still there.

With the ENORMOUS number of features this radio came with, of which I only use a small percentage, surely they could have included a feature to send an audible set of beeps when it's battery is near the end.

Has anyone else had this reaction? Surely I'm not the only one with this beef. More important, has anyone out there figured out how to modify it to allow some audible beeps at low battery? Surely Yaesu can do this if they want to, all my portable telephones have such a feature, telling you when its batteries are about to fail. How about it - Yaesu?

Sounds like you got all the bells and whistles, but they just ran short of beeps :-)

Maybe it was made on the friday afternoon of a 3 day weekend??

According to p. 10 of the Owner's Manual, it i supposed to show a "low

```
voltage icon" when it is time to recharge.  For the Li-Ion battery, it
shows four different icons, depending on voltage.

Accoridng to p. 68 of the manual, you can monitor the actual voltage
of the battery

No dispute with either of those, BUT they are about as useful as the classical "tits on a bull", though. If I have the radio in the clip on my belt, and am busy doing other things while waiting for someone to call, it might be dead for an hour or two before I think to look at the display. Furthermore, the voltage reading is ONLY given if there is only ONE line occupied with a frequency setup. And with it being a dual band rig, which is what I bought it for, then I cannot see the voltage when using it for dual band operation. Likewise the Icon of the tiny, tiny battery emblem when set for dual band operation is almost invisible to the eye.

Bottom line - it is very poorly configured for keeping on top of the battery status. Otherwise, a very good, but much "uselessly over featured" radio.

A simple beep like those on my several portable telephones is all it needs. It has other beeps, for features I'll never use, why not for this? I suspect if enough people complain, Yaesu can issue a mod to the software to provide this very needed feature.

Actually NASA used "quindar tones" which are in-band signalling to activate ground transmitters. Those beeps were removed by a notch filter and never made it into the uplink.

Good morning.
I hope someone has already gotten into this.

I own a Yaesu FT-290R that lately has been reported to produce a distorted SSB modulation.

I checked with another receiver and I can unfortunately confirm that the modulation sounds a bit warbled, fluttered, "bubbly" but still comprehensible (say "3 by 9" RS report).

Apparently the problem worsens when the rig is operated at lower temperatures (32F/0C or so). In low-power mode the modulation is slightly better but still unacceptable.

FM output is OK. Output power looks fine too, at least there's an increment between low and high levels.

Has anyone had this problem? Any cure?

Thanks,
pc

Are you certain your P.S. is stiff enough to handle the current on voice
peaks? Sounds like it's FMing some- many times a sign of poor regulation.

I tried with a 12V/7AH Pb-gel cell, a 12V/5Acont. and a 13.8V/25Acont. supplies. They provide slightly higher voltages (in that order), which reduce the effect, but not that much.

Anyway, for the FT-290R - which is a QRP 2m all-mode RTX - peak consumption is 800mA! (per technical specs)

I doubt all my regulated power sources have gone bad altogether... will check them anyway.

Paolo

Er, ok.

Anyway, I'm considering using the Degen as my daily listener, and relegating the DX-399 to storage. So I am interested in the here and now ("pre-Cheney bomb".)

So, let's get back on track and compare. Let's compare the relative sensitivity (MW-SW), and audio quality using earbuds between the following "ultra" portable models:

Sangean PT-80
Sangean ATS-606 (essentially same as Radio Shack DX-399)
Degen/Kaito 1103
Sony ICF-SW7600GR
Sony ICF-SW100

(Of course, there's a great variation in price, and in features. The ATS-606/DX-399 does not have SSB, which to me is not important, but to others is important. When I bought my DX-399, I paid ~$35, so it was a no-brainer to get -- I should have bought two.)

I'm sure a couple others could be added to the above list, but they should not be any larger than the largest already there.

Roger

The Sangean 909 is aka the Radio Shack DX-398, which I also acquired at
the same time that I acquired the DX-399. The DX-399 is about the half
the size. It is really a terrific choice for a backpacking tour of
Europe, Australia, Asia, etc. What a gem.

I'm not a big fan of Sony. They break.

I have an ATS-606A (it has 1 KHz fine tuning). I enjoy it. The PT-80
intrigues me.

Will everything everywhere be wiped out by the bomb? Will all
transmitters be wiped out? I figure that Europe will be spared, and thus
I can listen to the BBC. EMP covers a narrowly defined area. You can't
get it to cover whole continents unless you send it REALLY high up in
the atmosphere. The only rogue state with ICBMs is North Korea, and if
Kim would launch anything, he'd launch an actual bomb instead of an EMP
device. Of course, the USA could send up an EMP device over Iraq, but
they already have ways to counter cell phone triggered IEDs (now the
insurgents run wires).

Isn't "Miss Nude Islam" an oxymoron? In fact, isn't the beauty pageant considered to be against Islam? In fact, we'd probably have Dialing For Jihad, an imam will say a prayer to help your car bombing be successful, and will read appropriate verses from the Quran. All for 499 riyals. We'd have game shows like Tribal Feud, people try to guess what Muhammad actually said (And the Prophet Says...) with the winners killing the losers. We'd have Jerry Springer like shows: My Wife Shows Her Ankles In Public! The host would give the husband a scimitar to behead his whorish wife with, then the audience would attack each other. Ah, the brave new world of the universal Islamic caliphate!

>

Well, you won't find as good of a deal as Radio Shack had. The PT-80 is cheap and is a better clock than a radio, according to Passport. If you like the 606, get another one, but you won't get it for anywhere near $35. If you want a Degen (either the 1103 or the sister rx the 1102) then you can find new ones for $50 on Ebay. If you want a Sony, you'll pay through the nose ($150 for the 7600-IF you can find one). When there are better, cheaper portables out there, why bother? Bottom line: if you want an identical twin to what you've got, buy the Sangean. If price is a concern, buy the Degen. Oh, and ignore David, he's a weirdo.

Well, price is a consideration, but so is performance.

When it comes to receiver performance (sensitivity/selectivity/etc.)
how does the Degen/Kaito 1103 compare with the Sangean ATS-606?

From what I've read, the 1103 is a better performer in this regard. It
is supposedly at least as good in audio quality (to earbuds.) And
throw in SSB to boot.

The one downside to the 1103 compared to the 606 is that it is
slightly larger in size and weight (but not much.)

Anyone here done a side-by-side comparison between the 1103 and 606
(or the equivalent RS DX-399) with respect to MW-SW reception?

And where can I get a Degen 1103 for $50? I checked on eBay, but
haven't found a seller yet at this price. The best price I've found
for any 1103 is $89 (and a Kaito which is for the American market.)

Anyone?

Roger

Try an ebay seller named Liypn, his store is V Com Collections. His radios are labeled Degen and are for the Chinese market (but mostly labeled in English) and run around $45 or so. He doesn't use the name Degen at all in his posts, just the model "1103". Search for "1103" or some other radios he carries like "Tecsun" (called Grundig or Eton in the US) and some ads from him should pop up. Whenever I need to find his site I search for "Tecsun" and then look in the results for V Com Collections (be careful not to click the wrong store-two or three show up). I don't have either radio, so I can't give you a side by side test. Ask someone who has 100 radios (there are several here) for an opinion.

The 1103 beats all other SW portables price to performance wise.

Yes. The 1103 wins in sensitivity and sound over the 606. MW reception on the 1103 is excellent too.

Look for Liypn on eBay. His eBay store is called V-COMM COLLECTIONS.

Jackie

We are a nation of weirdos. The USA was started by weirdos Europe
didn't want any more. Lots of long haired pot farmers as I recall.

It's absurd to think that you'll have time to relax by the fire while
your generator humms along keeping your minute steaks frozen after
such an event.

This threat of war is fake. The pigs want to scare you into
submission. Bin Laden works for Bush (or vice versa).

On Ebay you will get the best price for a Degen DE 1103. The Kaito badged DE 1103 can be had in the U.S. for about $30.00 more.

Rather than trying to use the built-in wall wart charger I opted to rotate two sets of NIMH batteries and a separate charger. The built-in set-up for charging was not well designed because you have to set the number of hours for charging - no auto sensing circuit on either model. Leaving a portable hooked up for 12 hours seemed to defeat it's purpose as a portable.

Hello All,
I recently purchased a FT-857D to replace my ailing FT-100D. It seems
to be a great little transciever for the price. I had also purchased
the remote mounting kit for my vehicle installation.
I was a bit disappointed to see that you don't really get a "Full"
mounting kit for the price. Like the FT-100/D, you need to purchase the
Yaesu MMB-62 in addition to make it usable in multiple mounting
enviroments. What's even better is that there isn't any reference of
needing this mounting platform anywhere!
Looks like Yaesu over looked this one so beware. The mounts seemed to
be still available from many of the radio vendors.
73's
Michael

FS Nice ICOM IC-736 - HF/6m Base Transceiver. HF base transceiver RX: 500 kHz-29.995 MHz, 50 MHz-54 MHz TX: all amateur HF bands + 6 meters Output power: 100 W (40 W AM) Modes: CW, SSB, AM, FM. Includes orginal icom hand mic, built in tuner, built in AC power supply, and power cord. This transceiver has a Power Supply problem. For awhile it would take a few minutes to come on after applying power. When it does come on it works fine. Gradually, it has taken longer for it to warm up and come on until now it does not come on. It has got to be something simple in the PS but I am no technician. Cosmetics are very good. I can send pictures. These rigs are selling for over $600 in working order. My Price is $400. Thanks, Charlie Hugg, K5MBX

FS Nice Icom IC-275H 100 watt 2 meter SSB/FM/CW all mode radio. This is one of the finest 2m transceiver ever built, a GREAT performer. Complete with power cable and Handmic. Nice
condition-just needs new display lights (only needed under no-light condx). No original box. Manual is available on Internet. Price is $515 shipped in lower 48. Thanks, Charlie Hugg, K5MBX

FS Yaesu FT-2400H 2 Meter Transceiver. 50/25/5 watts. 140 mhz to 174 mhz receive and 140 mhz to 150 mhz transmit. It looks very good and works good, but will need memory battery replaced. It loses frequency and memories when turned off and taken off a power source. Also needs display back lights replaced. Comes with touch tone microphone. Picture available by email. Price is $90 plus shipping. Charlie Hugg, K5MBX

My brother sent me an Icom F3S handheld, nice radio if I can get it reprogrammed. I built a cloning cable and found a cloning program for the Icom F3, but it doesnt seem to work with the F3S. Does anyone have the cloning program? I would even be willing to send the radio to you to have it programmed and compensate for any time involved. Thanks for your time and consideration on the matter.

It's a well known fact that KB2SMS and N8WWM sell CB amps. Google up Doug
Adair N8WWM and you will see that selling CB amps and crappy homemade
antennas are there specialty.

Top forum subject at www.niggerandcrackers.com average jamal VS Taxim

average jamal cont. shhhh, let's listen in shall we.

Average JamaL Posted:

........when in fact political awareness has made racism worst. you crackers know that this shit aint even, now you wanna blame blacks for just saying f*#k it and caring little to none about fitting in. f*#k fitting in we should be in automatically.

so have a power cracker day and make sure you continue to look down on us instead of using your supposedly superior intellect to help us understand whats wrong. throw all us good people away with thebad ones even though we out number them 100 to 1. we should give up on you white f*#kers cause george bush is so stupid, but we dont. cause we care about america. this shit is hopeless, i am tired of my kids having to be niggers just cause afew are acting crazy. i am tired of watching my 11 year old kid be fingerprinted just cause he is playing outside in front of the house after 11pm in the summer with his friends. why does he have to get fingerprinted? this system sucks cause white people are instinctively racist and black people have been angry so long its starting to imprint our DNA. lets fix it. or at least try. instead of argueing you morons

White chicK posted:

"Your yard analogy was powerful. "......... I thought we were making headway on racial equality too until New Orleans. Boy was that an eye-opener. Look, I'm probably not a typical cracker. Wish I could put up a fight and defend the status quo but I can't. I think you're right. It isn't even. "Racial pride is one thing, racial superiority is another"

TaxiM posted:

Well, jamal, that was special, i especially liked the end. "Lets fix it." "You morons." I can see you're well on your way to becoming a mediator for race releations. "white bastards", "you crackers", "you white fuckers". Yeah, that's productive. And what's this "put down (over centuries)" BS? Have you been around for centuries? I sure haven't. So I don't see why I or any white people should have to feel guilty for things people we may or may not be related to have done in the past. But that's the race card. Poor me. It's someone else's fault. Just what this topic is about personal responsiblilty. There are plenty of successful blacks. All it takes is the motivation. Or will it just be cries for more handouts?

Join us in Cave City, KY on March 4, 7:30am CST
at Cave City Convention Center. I-65 Exit 53.
Talk-in 146.940 Repeater, Glasgow, KY
for the 30th Annual Cave City Hamfest.
Sponsored by the Mammoth Cave Amateur Radio
Club.
We continue to be one of the largest hamfests
in Kentucky with about 800 hams in attendance.
Admission is $6 (Kids under 12 free)
Tables are $7 each and 2/3's are already sold.
For tickets or tables   lbrumett@glasgow-ky.com

ARRL V.E. Exams
No Code begins at 9:00am CST

All Others begin at 10:00am CST
Upgrades bring copy of current license and ID
For exam info   crice@glasgow-ky.com

At the hamfest there will be an ARRL Forum and a 3.960 Group meeting. As always there will be FREE coffee early   and Door prizes all day.

Vendors will set up on Friday March 03 6 - 9pm and Saturday morning at 6am. Doors open at 7:30am Saturday morning CST.

Outdoor Flea Market spaces will be available if weather permits.   Please know that you can't hear the PA system outside. Every year someone complains...........

For additional information please contact Hamfest Chairman Larry Brumett KN4IV lbrumett@glasgow-ky.com

Thanks   Joe Taylor   N4NAS   n4nas1@hotmail.com

Hello to All of YOU!
I'm looking for an advice on two questions:

1. What radio should I buy between the two: Yaesu VX-7R or Kenwood TH-F6A
2. Where should I buy it from (price) or maybe someone sells one used ?

RE: the first question: I want this radio in order to be able to
monitor (listen) to all possible things: weather, radio, police chat,
trackers, taxi dispatchers an so on.
Also I would like to be able to talk back to some of them (definitely
not a police :))
If it's matter, I'm in San Francisco, CA and love to hike in Lake Tahoe
area of the Sierra Mountains.

Most frequencies REQUIRE some sort of license to "talk back".
It's unlikely that either radio can be used legally transmit outside the
ham bands.
Get a trunk-tracking scanner. Use your cellphone for talking.
mike

They're both popular radios with lots of features.

The VX-7R has 6-meter capability (which few people seem to use - there's not much 6-meter FM traffic in Northern California) and its 220 transmission power is fairly low. It's water-gasketed and can survive splashing and some immersion - but I've heard some people complain that the microphone's waterproofing membrane muffles the mic and makes the transmitted audio quality poorer than previous Yaesu radios.

The TH-F6A doesn't have 6 meters, and isn't waterproofed as far as I know, but has full-power 220 transmit capability.

These radios are likely to be fairly competitive in terms of their basic output power, sensitivity, and capabilities. Which you would prefer may be as much a matter of personal taste and operating style than anything else. I'd encourage you to try 'em out - at least for reception - before making a decision.

For all HTs of this level, programming the memories (potentially, hundreds of them!) becomes a significant challenge. Both of these radios can be programmed using a personal computer (running Windows or an emulator thereof), using suitable software and a special PC-to-radio cable.

Officially-supported software is available for the VX-7, but it's a commercial aftermarket product which is not cheap. There's also some reverse-engineered freeware (VX-7 Commander) to do the same thing.

Kenwood makes programming software for their radios available for free... it can be downloaded from www.kenwood.net

You'll need a suitable cable/adapter, to convert the RS-232 signals from your PC's serial port to the 5-volt open-collector signalling which these radios use for programming. You can buy adapters from RT Systems (they're sold with their Yaesu programming software) or from Kenwood. It's often possible to use one vendor's adapter with another vendor's radio, if you build the right sort of cable to go between 'em.

>2. Where should I buy it from (price) or maybe someone sells one used ?

The prices for new radios of this sort don't seem to vary much from one dealer to the next. I've heard that the dealer profit margins on such radios are very slim... there's not a lot of room for dealers to cut their prices.

You _might_ save a few dollars by buying by mail from an out-of-state dealer. However, the savings are likely to be small if the deal is honest. Since you've got a good well-stocked dealer in your area (Ham Radio Outlet over in Oakland) you could do lots worse than to just hop BART over to the East Bay and buy one locally. That way, you'll have the advantage of local-dealer support if anything turns out to be wrong with your radio, and might avoid having to send it back to the manufacturer for repair or exchange.

[The first VX-5 I bought, from HRO's Sunnyvale outlet, had a microphone which went bad after a few weeks. They swapped out the radio for a new one even though it was past the normal 7-day over-the-counter exchange.]

>RE: the first question: I want this radio in order to be able to
>monitor (listen) to all possible things: weather, radio, police chat,
>trackers, taxi dispatchers an so on.

All well and good. Both of these radios should be able to receive any AM or narrow-band FM signal in those bands. Neither will be able to handle the newer trunked-digital UHF systems.

>Also I would like to be able to talk back to some of them (definitely
>not a police :))

Not a good idea. Not legal. These radios are not certificated for transmission outside of the ham bands. Using them in that way can get you into quite a bit of trouble, for transmitting without a proper license and for transmitting using noncertificated equipment. Loss of amateur-radio license, big fines, etc. can result (and do so result from time to time).

>If it's matter, I'm in San Francisco, CA and love to hike in Lake Tahoe
>area of the Sierra Mountains.

I'd recommend that you buy a better antenna for whatever radio you get. The "rubber duck" antennas sold with such HTs are fine for most in-city uses (especially when using a local repeater) but they're not a great choice when you're out in the woods, far from your nearest repeater, and *need* to get a signal through. A "spaghetti-noodle" quarter-wave whip, plus a 19" counterpoise wire, will add a lot to the 2-meter range of a radio of this sort.

Without making a judgement call on your questionable comment regarding talking back on possible non-ham frequencies, I'll make two comments on those two radios. I have owned both in the past.

I preferred the Kenwood for two primary reasons:

The Kenwood was capable of receiving SSB in the HF frequency range, albeit the sensitivy was EXTREMELY POOR in that regard.

I highly prefer the Kenwood Menu system.... it was much more intuitive to use compared to the Yaesu radios.

Both are well built solid transceivers, though.

Ed   K7AAT

I was just looking at those very two models after getting
my callsign (KE7GKP) just yesterday.

I just bought the Yaesu this afternoon and am still reading
the book.  The Yaesu was recommended very much in
preference to the Kenwood by the guy at HRO in Portland.
He claimed the opposite, that the menu system of the Yaesu
was simple enough that he needed the book only once every
vew months, but the Kenwood he never could manage.
Go figure?  :-)

While you may be able to receive most/all of those
sources (because both models have a wide-band
receive function) , it is very unlikely that any of those
services are using ham bands, which would preclude
you from "talking back" to any of them. Also neither
radio will transmit in the bands they are likely to use.
Fortunate for you since is is almost certainly very illegal.

A "scanner" type receiver seems more suitable for
listening to the various services you mention. Particulary
in a large city where they use "trunking" and other
systems for sharing (and jumping around) between
different frequencies. Many scanners are progrmmable
to handle this. But neither of the radios you mentioned
can follow these kinds of conversations.

It would be hard for me to figure out why an HRO sales person couldn't
program a Kenwood.  It's too much trouble on any radio without a
computer when you have hundreds of frequencies to input, along with
various option settings.  With the free Kenwood software and a cable
it is a simple chore.  I would much rather operate my computer than
the tiny buttons on an HT for programming.  BTW, the TH-F6A is the
finest HT I have ever owned, and I have owned a LOT of them.  I also
own the TH-D7A, but it is the F6A that goes with me on public service
events, etc.  I love that little radio.

Dick - W6CCD

I spent nearly 2 hours at the HRO in Oakland trying out both - After some
serious thinking I ended up with the Kenwood.
At that time it was because I felt it wiser for me to opt for 220 over 6M in
a HT. After well over a year of using the Kenwood, I have to say that it is
by far the best HT I have ever had.

Drawbacks?
No drop in charger.
Speaker Mic and pwr jacks are on the side instead of the top.

I often wonder why anyone would want 6M in such a small qrp format unless
they lived within eyesight of a 6M repeater.

Jim..

You could probably get away with bolting a Kenwood TS-440S/AT under the dash on the passenger side! ;-)

No really - look at the catalog for the compact mobiles with the remote heads. You could probably fabricate some sort of mount that slips into those vents above the stereo.

Personally? I drive a Mustang and use a TH-F6 Triband HT that fits in my shirt pocket.

I did the TS-480HX with Turbo Tuner and Tarheel M-200 screwdriver, and
FT-7800R with glas mount dual band antenna in my Tundra.... it worked out
well. pics here.
http://ph.groups.yahoo.com/group/TS-480/photos/browse/e113
The remote faces on these rigs were a great help.... the body of the radios
can be mounted most anywhere.

> And the old Heathkit clock still ticking!!!! Amazing!!

Ken Kuhlman, former "General Products" Heathkit engineer died of kidney cancer on January 24th.

Ken grew up in Kansas and developed a deep love for electronics as a teen. While he never got a ham ticket, one of the first electronic projects he built was an operating telegraph system running between his and his brother's tree houses. He graduated from Wichita State University with a BSEE degree in 1964, and worked at Heath for over 25 years.

During his tenure he developed many very popular kits such as the GR-1075 Digital
Clock Radio and also contributed to the automotive products group, as well as testing and development of the Heath/Zenith laptop computer products. He was an avid car fan and had restored a 1957 Austin Healey, which he loved to drive around on any warm day with the top down.

I was privileged to work with Ken a little at Heath, and for several years shared office and lab space with him at Whirlpool. Ken always commanded respect for his knowledge of most anything electronic. He retired in 2002, but returned a couple of times a year to keep up and say HI. He will be greatly missed by all of his friends, wife Judy, kids Tom and Molly, and 3 grandkids.

Doesn't seem too amazing to me.  I have a clock just like that working
perfectly.  As does all my Heathkit equipment no matter what the age.
We even have a Heathkit bathroom scale that we use every day.  Built
it about 25 years ago.  If you take care of them, I think they will
last forever.

Dick

I have owned this radio for many years having bought it new. I had planned on installing it into my isuzu trooper but never actually managed to get around to it. It has had no more than three to four total hours of use, if that. I has mainly been sitting on a shelf waiting to be installed. It has never been installed in a car and the little use it has had was on the bench with a bench top supply. It is in excellent condition with everything except the original box.

Asking $225.00

Contact me at pwborders at cox dot net

I have had this radio for a few years. I bought it new at a local hamfest. It is a very solid and reliable performer. Not overly complicated like some of the newer HT's but with all the features you could ever want in an HT. I have used it very little, probably not more then 15 hours total, mainly monitoring. It is in excellent shape and everything works perfectly. The memory expansion module ME-1 is installed as well. The batteries are a little old but have very little use so a few charge / discharge cycles may bring them back to full capacity. No guarentee on the batteries though since they are a little old.

Includes

- Kenwood TH28a Handheld Radio
- Rubber Jack Cover
- Lanyard
- Belt Clip
- Original Rubber Ducky Antenna
- PB13 7.2v 700mah Battery
- BC-14 AC Adaptor / Charger
- Original Manual

Extras

- ME-1 Memory Expansion Module
- W & W Associates:
    - 2 - PB18 7.2v 1500 Mah Batteries
    - Master Charger I With:
        - AC Adaptor
        - Kenwood PB Battery Cup
        - Icom BP Battery Cup
        - Yaesu FNB Battery Cup
- MFJ 287 Mini Speaker Mic
- DC 12v Car Cord
- BT8 6 AA Battery Case
- UPC-8 HT Cradle and 8" Pedestal
- Car Window Holder for Belt Clip Radio and Mic

~~~~~~

Years ago I had a car where the battery terminals came loose every couple of weeks, despite tightening the clamps to a fare-thee-well. I couldn't figure out why until a very car-smart friend pointed out the clamp that held the battery was loose. Normal road vibration caused the battery to wiggle around just enough to loosen the clamps.

A word to the wise.

Here's another.

I once had a battery with a very slight leak around one of the posts, and the terminal kept corroding and making poor contact. I took the terminals lose, cleaned everything with baking soda, rinsed and dried all the parts then sanded the posts and inside of the clamps to get a fresh lead surface.

Here is the tip. I coated both surfaces with a film of heavy silicon grease (Dow 111, or similar) and re clamped the terminals, squeezing out the excess grease as the clamps tightened. Even though the outside of the terminals still got visibly corroded the connection remained perfect till the battery failed a couple years later. I have pretreated every battery, when new, ever since, and have never had a connection problem. The grease completely seals out moisture, acid and oxygen, but is about as easy as air for the lead surfaces to break through to make perfect contact.

I see that some headlight bulbs now come pre-glopped with a dollop of such grease to protect the wiring terminals from moisture.

WD-40 also works quite well, as it penetrates and lubricates, and there is less mess. I run dual Optima yellow tops in my Wrangler, and a heavy duty conventional (normal maintenance) battery in my XYL's Grand Cherokee and in my Cherokee, and WD-40 has kept corrosion off of the terminal for years now. Works much better than the soaked red and black corrosion inhibiting felt rings. Just a thought...

Keep the bolts tight. Don't forget to run a heavy enough gauge fused wire pair to the rig to make up for voltage drop over your run length (lest you end up with a 30A load dropping the voltage to 10 or 11V and diminished RF output). Your rig was designed to operate as rated at 13.8VDC. With the engine off, you might get 12VDC. With too light a gauge of wire in a long run, you'll see your display dim or go out as the voltage to the rig drops below the minimum required voltage at the radio when keyed.

When I get a battery terminal with the corrosion and oxidation on it, I sometimes pour a small quantity of Coca Cola on it. Cleans them right off. I will then put a small amount of conductive grease on it.

Back when we were kids in the 5th grade, a common science project was
to put a nail in a bottle of coke and watch it dissolve over time.
Not a pretty thought for your insides.

Your education might not help.

My wife and I own a half-dozen VHF/UHF mobiles and 3 HF rigs. The manuals for each/every one of them say they should be connected directly to the battery if used in an automobile. That's a fact. They do say that.

Why? Now that's conjectural! Whatever anyone says, except the authors, is merely that persons guess.

I suspect it has more to do with human 'engineering' than any electrical reason. There are any number of ways to hook up a radio in most cars, including via the cigar lighter. The arguement about exceeding alternator output is grasping at straws - I know of no modern mobile that draws more than the 45 (and more) Amps supplied by even 'wimpy car' alternators.

OTOH, If every ham who buys a radio tried to connect them to the main power bus of a variety of cars then some of them would do it wrong, let the smoke out of something, and blame the radio manufacturer. But, connecting directly to the battery is generally so easy that even modern "appliance" hams can do it without burning up their cars. So the mfgrs take the easy safe way out.

But that is just my opinion - no better founded than many others.

I am hoping I don't have battery oxidation in my stomach.

I just completed the installation of an FT-857 in my truck. My previous 857 and truck were lost in Hurricane Katrina.

This installation went along just fine but something is not happening.

I set up the antenna menu for the rig to use the ATAS-120 on HF and 6; I use two antennas -- the ATAS-120 on HF and 6, and a dual-bander on UHF-VHF. I went through all the setup steps according to the manual.

As I recall, when I changed bands, or when I moved more than approx 10khz on HF, when I hit the PTT button, the display said WAIT until the ATAS-120 tuned itself then the rig transmitted. It's not doing that -- I can copy signals and the ATAS-120 seems to be tuning, but, when I try to transmit, the display says SWR and I don't see any power output -- and, I don't see the WAIT indicating it's telling me that it's tuning the antenna.

Can someone help me out here?

Thanks.

By way of clarification: If I select menu option K (I think it's K) and hit the A (TUNE) button, the antenna will tune -- the display shows WAIT and the meter indicates high SWR which eventually is tuned out, then the display goes back to the frequency I was on. Thus, I can tune the ATAS-120 by leaving the righ on option K and hitting the A (TUNE) button when I change bands of move freqs.

As I recall, the radio I lost in Katrina did this automatically.

Thanks.

I'll be a little vague looking for gear that made for the US ham 60 m band (the 5 channel USB one) or that can be easily fitted for just those freqs

(i could modical my FT 847 but i hate to open up something that complex

any thoughts (please hold the flames

You can wire these anyway you want, (well at least old school hams did)
That mic's been sold.

Yes Jack
That clocks been going since 1975, with perhaps a 4 year break
I had to bring the anode up to around 220 volts a couple years ago with a
simple voltage doubler mod.
It also has a smaller Sperry display on the seconds the original went
completely dead
Sperry SP-352's are a hard $$$ find in 2006

-Joe

I'vw been around, but in keeping with what The Uncle used taxpayer money to train me to do well, I do a lot more "listening" than "talking".

When I did the 12V installation at home six years ago, my wife - who is a power utilities engineer - demanded that the installation meet not only UL specs but USCG specs for low-voltage marine installations. That automatically raised the cost by more than double, but it sure looks purty, especially the digital metering and LED circuit status indicators, everything on breakers, the whole bit. The gel-cell battery is in a plastic "doghouse" outside and I do have dual

chargers/standby supplies "inside". I had to find a good source for
4 AWG "zip" cord and wound up using automotive jumper cables with
suitable terminals crimped on (I do have the large crimp tools....).
I understand now that that size may now be availavle at high-end
auto sound shops. I do miss the big barrel of welding cable that I
carted around for decades and finally disposed of ten years ago.

Now if I could only convince her that we really need that 48 KW
(240V, 200 A) natural-gas-fired Genset that I've had my eye
on.....all it takes is about $15K including the rewiring of the
underground supply, new meter base, and upgraded breaker panel as
required by the local electric company and city codes.

You might want to come over to SmokStak.com and chat with the
Old Iron Generater crowd....they always have some good ideas
for doing that sort of thing.

Hi,
I have a slightly sick Cushman CE50-TG-1 and was wondering if anyone
has taken any voltage readings from a working unit they would be
willing to share.
I need to check the voltages at test points 3 & 4 on the 29000 board
with the frequency set between 9.9999mhz and 100khz. That should give
me the normal range for both the A & B VCO's control voltage's.
(referenced to chassis ground) Any other voltages would be helpful so I

can note them for future reference.
Sure would have been nice if Cushman would have provided some basic
voltage readings on the schematics.

Any help would be appreciated,
Thanks,
RoD

I installed a VFH/UHF radio in a 1997 Grand Cherokee. The RF antenna is approximately two feet horizontally, and slightly higher from the Jeep's radio receive antenna. If I was listening to the vehicle radio and keyed the VHF radio, it would mute the vehicle radio. The vehicle radio finally is no longer working, except for one station. I am assuming an induction problem. Technically, what exactly happened, how, or not to fix the vehicle radio. How to prevent this problem in the future. I raise this question not so much for the sake of the Jeep, but because I am proposing to a put a VHF/UHF rig in the lady's 2005 Honda Accord. The only viable place on the car is a trunk mount. It appears the car radion antenna is embedded in the rear glass and I believe this area is also where the XM radio antenna is located. I have tried to contact Honda on various levels but have had no success. I am wondering if I put the VHF radio in the car, will it "burn out" the other radios. This should give something for a lot of conversation. I hope I can get some help.

Thanks,
Ethan Davis KB3EGG

```

A coil-loaded counterpoise at a low height above ground is used to provide an artificial ground for an antenna when, for some reason, a true ground connection is not possible or there is not enough space to erect a full 1/4-wavelength horizontal wire.

The principal effects of low height are a loss resistance induced in the wire from the ground, and a reduction in propagation velocity along the wire.

A counterpoise can be considered to be an artificial ground. Its input resistance at resonance is equivalent to the input resistance of a true ground connection but its resistance will never be as low as a good ground.

To provide a lower input resistance three or four counterpoises can be used in parallel. Or they can be resonant on different bands.

New program C_POISE estimates the performance of a single coil-loaded counterpoise. The number of turns on a coil of given length and diameter needed to resonate a low wire to 1/4-wave resonance is calculated. The input resistance at resonance is also estimated..

All program output data is approximate due to the very low height of the wire above ground and uncertainty in the characteristics of the soil or whatever other materials may be under the wire. The wire may be allowed to rest on the ground surface but uncertainty will be at a maximum. It will nearly always be needed to prune the wire length for resonance. Or when the wire length is fixed the coil turns may need adjustment.

When wire height exceeds wire length accuracy is much improved. Input resistance at resonance will be fairly small. Working Q will be high and the counterpoise will behave as a short antenna. For precise resonance the wire will still need pruning.

Download program C_POISE in a few seconds from website below and run immediately.

In our 1996 Chevvy Cavalier have a 50W VHF / 35W UHF rig into a dual-band mag-mount on the roof and the vehicle radio antenna is on the rear fender, about 3 feet away. I have never had the type of front-end overload that you describe.

>The vehicle
>radio finally is no longer working, except for one station. I am
>assuming an induction problem.

Not an "induction problem". Maybe perhaps the rf did damage to the auto radio's front end, reducing the sensitivuty of the radio, or did some damage to the digital circuitry used to tumne and control the radio. You did not specify if the problem was with the AM or FM bands.

Of course, that's the high-tech discussion. Perhaps the problem is a bad antenna-to-auto radio connection. I had that happen once in a 1976 Plymouth where the radio's antenna socket was not soldered to the radio chassis.....

>Technically, what exactly happened, how, or not to fix the vehicle radio.

It may be cheaper to have a good quality after-market vehicle radio installed rather than pull the old radio, have it repaired, and reinstall it. If we decide to keep the Chevvy much longer, we need to do that to replace the jammed cassette tape portion of the radio. We'll take it to Circuit City or an equivalent radio shop - the days of standing on my head to repair car radios or install 2-way rigs are long passed, and I wouldn't have a clue how to disassemble the Chevvy to take it out. I'll leave that to others - it's worth the price.

>How to prevent this problem in the future.

We had this happen when a 100W VHF radio took out the front end of a very expensive spectrum analyzer which was connected to an antenna on a mast 10 feet away from the comm antenna. The solution was not to key the comm radio unless we were sure that the analyzer was disconnected from the antenna lead.

There should be some front-end protection in a high-end auto radio. Check it out before you buy.

Why can't you put the antenna on the roof "as God intended it" ?? I prefer the mag-mount because with a flick of the wrist I can take it off to go through the car wash or leave the car in the shopping center parking lot for an extended time and not have it be a break-in target.

BTW - I understand that Honda cannot be bothered to answer such questions from buyers of their products. Don't take it personally. Perhaps your dealer can help you better than "Honda".

Hi all, I have a Emotator 103 SAX that the direction indicator circuit
has failed. I bought this rotator about 20 years ago and have since
lost the manual. Is there anyone there who can send me a copy of the
circuit diagram for this rotator?
I have searched the net and have not been able to come up with anything
relevant to this rotator.
Thanks in advance
Mike

No tears shed over that loss, eh? I've used a club MV Field a number of times, and it just didn't impress me. doing simple things required diving into the manual, heaven help a person if they lose the manual. My pet peeve was the brightness of the display. It wasn't bright enough, so I looked in the manual, and after 5 minutes found the menu item to change the level. Go to it, and find out it is already at the brightest setting. Really, if they want to design an inadequate display, why offer the option of making it even dimmer.

But that is just one of many issues. Using that variable speed tuning doodad in back of the dial was either too slow, or waaaaayyyy too fast. Did I mention way too many menu items?

The auto tuner seemed to have less range than other radios. It wouldn't tune an 80 meter dipole across the band while an old IC-765 (now that's a radio) would easily tune it. Tuning seemed a bit slow in all cases.

Did have a good notch filter, though. Audio filters were okay. I found myself using only one or two though.

But all in all, it just wasn't much fun to operate. Perhaps all parts of the reason it has been discontinued

> I looked at the Kenwood TS-2000, but it is just too ugly. Multiple

Hard to say. The bad reports weren't too frequent. But you are right - the radio IS ugly....

Read the owner's manual. It will advise what precautions, if any, need
to be taken with regard to two-way radios.

As far as the dealer goes, they offered to look into it but had no better luck than I did. What is frustrating is that when they are approached with such a question, it is as if I have just come from the darkest regions of Africa, with some strange object or ritual they have never heard of, or seen.

Thanks for the reply

Ethan Davis KB3EGG

No luck with the owners manual. Technically, the radio should be protected by the manufacturer, but like other large businesses it is part of that business to protect itself against liability by not offering concrete guarantees, or suggestions on the proper method of protecting the car's radio.

ulan@certainty.net wrote:

> I installed a VFH/UHF radio in a 1997 Grand Cherokee. The RF antenna is approximately two feet horizontally, and slightly higher from the Jeep's radio receive antenna. If I was listening to the vehicle radio and keyed the VHF radio, it would mute the vehicle radio. The vehicle radio finally is no longer working, except for one station. I am assuming an induction problem. Technically, what exactly happened, how, or not to fix the vehicle radio. How to prevent this problem in the future. I raise this question not so much for the sake of the Jeep, but because I am proposing to a put a VHF/UHF rig in the lady's 2005 Honda Accord. The only viable place on the car is a trunk mount. It appears the car radion antenna is embedded in the rear glass and I believe this area is also where the XM radio antenna is located. I have tried to contact Honda on various levels but have had no success. I am wondering if I put the VHF radio in the car, will it "burn out" the other radios. This should give something for a lot of conversation. I hope I can get some help.
>
> Thanks,
> Ethan Davis KB3EGG

I own a 1995 Ford Explorer and have it equipped with a 50/144/440 radio that runs from 3-50 watts. I have my VHF/UHF antenna permanantly mounted on the roof (Larsen low profile 18" dual band). I run the radio into a diplexer and have a separate antenna for 6 meters. The way I have it rigged up is the 6 meter antenna also serves as my AM/FM antenna through the use of a splitter. I also have a 100 watt HF radio with a multiband antenna on the rear bumper.

I have noticed interaction with my AM/FM radio at the 3 watt level on UHF. High power almost always takes out the broadcast station but the receiver has never been damaged.

When I transmit on HF, I can hear the SSB signal over the car stereo speakers.

You don't mention how much power you are running but if your transmit antenna is only 2 ft from the AM/FM antenna and you are running 40-50 watts, I would not be comfortable with that distance.

As for fixing the existing radio, you would probably be cheaper to get some aftermarket system. Just be aware, when you do, if you are using existing OEM speakers, often times, there may be an impedence mismatch with the OEM speakers and an aftermarket receiver. Most aftermarket units are 8 ohms. I have seen OEM speakers that were other impedence.

Andy

As I recall there is something about it in my 4-Runner manual, but the
Toyota dealer installed the Kenwood TM-D700 for me so it was ready to
run when I got the car.

FS: Icom 706 MK II
HF transciever plus 6 Meter and Two Meters
Has mobile bracket/ Mic/short power cord with fuse.

Has all the optional modules it would take (has the ones that now come
standard ) I really like the little DSP notch filter best. It  has a
nice narrow 500Hz CW filter also. Was mobile, has minor scratches, but
by no means, looks beat up.

The microphone took some modifications a couple years ago when it was
used with a pair of units in PSK31 applications so you might have to
replace the element.
If you close talk the microphone its fine, otherwise replace mic
element.
Does full power!!!

Looks and works fine!!
Price: 435.00 Shipped Firm.

I know at least one higher up at a major Ham radio manufacturer reads these news groups, so maybe this will make it in to the right hands.

How many of you prefer a real analog d'Arsonval movement S/RF meter to a digital bar graph S/RF meter?

My vote goes for a great big detailed analog meter with a real needle any day. Give me a radio with a great big Kenwood TS-940s S/RF style analog meter, and forget about the LCD/LED S/RF meter. Even the LCD attempt to look like a real analog meter just does not cut it for me. If a moth can't land on the needle and go for a ride it's not worth watching.

:)

Available on eBay (item #5862005427) is a complete set of four Motorola MX350S Synthesized, DES Encrypted VHF radios. These former White House Communications Agency radios comes with a six position charger/conditioner, batteries, manuals, RF test cable AND a DES Keyloader. Because this system uses DES Encryption, it can only be shipped to a U.S. address.

<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5862005427>

Thanks,

S

This item is available for quite some time now but I failed to find any comments, reviews etc.:
http://www.timewave.com/TZ-900.html
It is for sure an interesting piece of equipment, but maybe it's the price tag which is the problem.

I agree, on both counts. The developer of it did a demo at a local ham-club meeting a few months ago. The commonest reaction among the audience members seemed to be drooling (over the features and capabilities) and winces of pain (at the cost).

Its price seems to be in the same ballpark as the couple of HF-band vector network analyzers that have become available in the past few years (the N2PK and TAPR/Ten-Tec versions) and unlike those VNAs the Timewave is self-contained and does not require a PC for control and display.

On the down side, none of these VNAs is able to operate on the 2-meter or higher frequencies (although I understand that the N2PK has some VHF narrow-band extension add-ons). Since the Timewave is roughly twice the cost of the MFJ antenna analyzers, and won't operate above the 6-meter band, its appeal to most amateurs is probably somewhat limited.

It's a nice piece of kit. I'd enjoy having one myself, but wouldn't
use it enough to justify the cost.

It might be the sort of thing which would end up as club gear, for a
club of well-heeled HF/DX enthusiasts.

FS: Icom AT-180 Antenna Tuner

Frequency Coverage: 1.9 - 54 MHz (Includes 6 mtrs)
Input Impedance: 50 ohms
Maximum Input Power: 120 W
Minimum Tuning Power: 8 W
Matching Impedance Range:
16.7 - 150 ohms (HF band)
20 - 125 ohms (50 MHz band)
Tuning Accuracy: Less than SWR 1.5:1
Insertion Loss: Less than 1.0 dB
Power Supply Requirements: 13.8 V DC/1 A (supplied from the

```
transceiver's ACC socket)
Weight: 2.4 kg; 5 lb, 4 oz
Included is the Coaxial Cable (1 m), ACC Cable (DIN 13 pins) for Icom
706 series radios.

Was mobile has a few scratches,
But not beat up at all.
Works and looks fine, comes with cable.
Was used on a Icom 706.
Comes with mobile bracket as well.
Price: 200.00    Shipped and Insured

Hi,
I have a slightly sick Cushman CE50-TG-1 service monitor and was
wondering if anyone has taken any voltage readings from a working unit
they would be willing to share.
I need to check the voltages at test points 3 & 4 on the 29000 board
with the frequency set between 9.9999mhz and 100khz. That should give
me the normal range for both the A & B VCO's control voltage's.
(referenced to chassis ground) Any other voltages would be helpful so I
can note them for future reference.
Sure would have been nice if Cushman would have provided some basic
voltage readings on the schematics.

Any help would be appreciated,
Thanks,
RoD

I did, they arrived, I hooked them up and after a couple of hours they
were just like my other 15-year old Minimus-7's - the foam surround
crumbled and fell off the driver.

Well, now I have 6 Minimus-7's, 5 with basically zero foam surround
left and one that's just on the verge of falling into pieces.

I gotta learn how to fix these foam surrounds! Either that or buy some
brand new drivers.

Tim.

Xref: g2news1.google.com rec.radio.amateur.equipment:2396
rec.radio.amateur.misc:4069 rec.radio.shortwave:21499

I currently own a Radio Shack DX-399 (same model as the Sangean ATS-606), which is a quite solid, portable LW-MW-SW-FM receiver with quite good sound quality when delivered to ear buds (FM stereo to earbuds.)

I mostly use this radio for local MW and FM listening, but will occasionally listen to SW broadcasts, and DX-MW using a Radio Shack loop.

I love this radio for its portability, but am looking for another to put one of them away in a Faraday box for use in case of a major emergency.

So, what other makes/models should I consider? Repeating some of the above, here's my criteria:

1) The size of the DX-399 or smaller.

2) General coverage MW-SW (up to 30 kHz), and with stereo FM (when fed to earbuds). Don't need LW.

3) Good sound quality (especially of FM) when fed to earbuds.

4) As good or better sensitivity than the DX-399 for MW dxing and SW.

5) Don't need SSB, but would be nice.

6) Don't care too much about speaker quality, since I would use it exclusively with earbuds.

7) Don't care about the other bells and whistles (e.g. alarm), but some station memory would be nice.

So what are my other options? New and/or used (buyable through eBay) will be considered.

Thanks!

Roger

Buy a second DX-399 if you can find one. Either that or a Sangean
ATS-606. It's clear that you like the radio a great deal, so why mess
with a good thing?

I own a DX-399. I bought it when Radio Shack lost its mind and dumped
the Radio Shack brand SWRs. I think it is a terrific little radio. Its
oddest likable attribute has to be the multiple voltage wall wart. With
the included adapter, you can use it in Europe on 220 Vac.

Look in your phone book for "speaker repair." The foam disintegrating
happens a lot in dry climates, and if the voice coils aren't too
abraded, they can be replaced by a speaker repair tech.

The voice coils get abraded by using the speaker as the foam is
disintegrating, and they wear against the surrounding magnet and
frame.

Seems like the Grundig/Eton YB-400 would fit the bill for you as well.
Might be slightly bigger than your Radio Shack model, but has the
features you mentioned, and then some.

Don't know what size your Radio Shack DZ 399 is but I have had the Sangean
 909 for years and it works great and it is a good travel radio or
emergency one too. It may have more bells and stuff than you what but in an
emergency they may be handy to have as well!

I carry mine in shirt pocket daily. excellent AM and FM  and 2 SW bands
which receive the stronger stations

price ~20.00

Tell us more about your emergency scenario?
Although it's possible to come up with a situation where there's an EMP
that doesn't get thru your faraday box and doesn't kill you, either
directly or indirectly...
I think you're much more likely to succumb to a dirty bomb or car bomb
or bird flu or be hit by a bus or killed by a jealous spouse or your HMO.
What are the other parts of your survival strategy? Radio doesn't
do much good if you don't have food/water/shelter.

Hmmm, wonder if the radio transmitters are in Faraday Boxes?

I kinda like the Sony ICF-SW-100.
Sound quality is awesome for it's size.
Make me an offer.

There are now DIY foam-surround replacement kits
available. Apparently easy enough to market to the
more competent of the general public.

I just passed my Element 2 test this afternoon (and missed Element 3 by only 3 questions even though I haven't yet looked at the General class question pool :-)

So I will be looking for some VHF/UHF equipment (HT & mobile?) in the next few weeks. I had looked around some websites several months ago and concluded that there was a particular brand/model of HT that seemed to be both widely-used and highly-regarded. But now I can't remember the recommendation (or the websites). So IS there a "sure-thing" or "everybody's favorite" HT or mobile rig out there? I'm not averse to 2nd-hand if there is some way to confirm proper/legal operation.

I have some years of experience in audio,video and general electronics, and I know when newbies (like me) come to one of those newsgroups with this kind of question, everyone rolls their eyes and makes snide remarks about such a public display of ignorance So I know I risk looking silly coming and asking this. But hey, they say there are no stupid questions except the ones you didn't ask. :-)

If it makes any difference I am in the Portland, OR metro area. Assuming I will find out sooner or later what the local scene is like.

I like my Icom IC-706MkIIG (HF/6/2/70cm), which I occasionally use mobile (with a set of Hamstick antennas) but mostly use at home with a long wire and the AH-4 autotuner.

When I was living in an area with many 220MHz repeaters, I bought a Kenwood TH-F6A HT, but now that I'm in an area without much 220MHz activity I might pick a different one -- perhaps the Yaesu VX-7R (which has 6M and does cover 220 as well but only with a minuscule power output). Check a repeater directory to see what frequencies are in use in your area.

I second Perce's recommendation on checking the repeater directory; it's a safe bet that most areas have 2 meter coverage, the landscape changes though when you look at 220 and 440. For instance, in the Los Angeles most 440 repeaters are private (closed) systems - 220 does not have as many repeaters but a higher percentage of them are open. Check to see if there is a local ham club - that would be a source of info for what bands are most active.

As to which equipment, I did use a Yaesu FT-50 and it served me well, however it saw some extremely hard usage (in inclimate weather, several drops, banged around in a briefcase etc) and sometimes gets a bit flaky even after a couple trips to Yaesu service. Don't get me

```
wrong - I have no problems with Yaesu, just gave this handheld a
little too much rough treatment.  Opted for the Kenwood TH-F6 as a
replacement due to it including 220 which I use sometimes so now I
only need one HT instead of two.  Try to keep in mind that choosing
equipment is like choosing a car in that some folks like Ford and
others Chevy and you'll find the same with ham equipment.  Generally
if you buy from Kenwood/Yaesu/Icom you'll get a decent product; it
comes down to which features (and band combinations) you want/need,
which one feels best in your hand and which one seems more intuitive
to operate (program).  You can often find the manuals online and
checking them out might help.   For mobile equipment look for
something that has a removable control head if your vehicle is cramped
for space.  Dual band radios come in two basic varieties : 1) both
bands on at once and 2) one band at a time.  As you might guess,
option 1 tends to cost a bit more.

So, I didn't directly answer your question but I hope I gave you some
information that helps you make a good decision.  Congrats on the
license & welcome to the amateur community!

Howard

I was wondering why he needs to put the radio in a faraday cage myself.
I've read that a typical EMP pulse bomb like Al Qaeda would most likely
use would mostly work on anything *that was on the same frequency*. That
means that if you're not in the immediate area, and your radio antenna

isn't harmonic with the wavelength of the pulse, you have nothing to worry about. Dark Angel type scenarios where the whole country is wiped out by an EMP pulse apparently aren't very realistic, but they make for good TV. I think a dirty bomb is more likely. But the real threat is bioweapons-if Iran could weaponize bird flu or smallpox and make it into a super killer then the shit would hit the fan. Smallpox has the potential to kill 9 out of 10 people, that's what it did to the Indians. I'm more worried about a flood since I live in a part of California that has frequent major floods. I just worry that I wouldn't have the presence of mind to take my Degen, since I'd have 15 minutes to evacuate. A lot of the New Orleans refugees didn't have radios, and the lack of info caused by that and govt bungling caused much of the panic.

Don't mount the ham antenna and the broadcast antennas within 2 feet of each other. 4 or 5 feet would probably make the difference. They are about 6 feet apart on my 4-Runner and I notice no interaction even when running up to 160 watts on 2-meters.

>It appears the car radion antenna is embedded in the rear glass and I
>believe this area is also where the XM radio antenna is located. I

I doubt it'd bother the XM satellite antenna as that is so far removed in frequency from the ham frequency, BUT it depends on how well grounded that system is. If the feed line is not grounded right at the window it could also pick up signal from the ham antennas.

>have tried to contact Honda on various levels but have had no success.
>I am wondering if I put the VHF radio in the car, will it "burn out"
>the other radios. This should give something for a lot of
>conversation. I hope I can get some help.

Any time you mix radio systems there is *some* risk. It may be miniscule, and it may not. You should see what we have to go through to get an IFR certified GPS system installed in an airplane. It has to be tested "in flight" against all of the other radios in the plane before it can be certified.

Then again, some where, some one will find a way to do it. I prefer to let some one else find the best way. It's both easier and cheaper that way. <:-))

Hi all,
In the manual for the FT-857 there are a number of CAT commands listed.
I know that the FT-857 support a huge number of commands "not" listed in
the manual. If you have tried the Ham Radio Deluxe rig control/log
program you probably noticed that every menu item in the FT-857 can be
changed using the CAT interface.

Has anyone came across any listing of these not documented CAT commands?

First one that will set up a serial line sniffer and list everything
going in and out from Ham Radio Deluxe to the FT-857 to back-track the
CAT commands, I will by a beer. I have a free software serial port
sniffer if anyone feels like giving the CAT interface a challenge?

Al Qaeda has no bombs. They don't need them. The destroyed the USA with $20 worth of box cutters (and the help of an incredibly incompetent [or worse] administration).

Richard,

I also am a Newbee to Ham but I got a Kenwood TH-F6A HT and love it. I'm in the L.A. area so I find 220 more open than 440 but I figure where ever I go I'll all three bands covered with this little HT. I too am looking into an mobile for the truck and/or the home. The Yaeshu FT-8900 dual band or the 8900 quad band looked nice to me. Good luck.

"Ultra" portable inherently means a very small ferrite bar antenna for LW-MW reception. Which will preclude any strong stand alone performance on LW-MW without an external LW-MW antenna like the Terk Advantage AM loop or something else for LW.

My picks for the ultimate "Ultra" portable are the Sony ICF-SW100 or ICF-SW07. Both have Synch Detectors.

I thank everyone for replying to my inquiry about the best small portable MW-SW-FM radio meeting my list of specs.

With regards to the various "Faraday Cage" comments, I'll not reply to them in any substantive way since that is off-topic here (want to focus on "radios"), but for those interested, just do a Google search on "EMP Faraday," and several informative articles will result.

Now, as I look things over, I'm getting more and more intrigued with purchasing a Degen/Kaito 1103 portable.

So, where can I find this model at the lowest price? Also, should I stick with a Kaito (for the American market), or can I consider a Degen? (I heard the walwart with the Degen is not for U.S. voltages.)

Thoughts? Recommendations?

Thanks!

Roger

laugh

Well, David recommended I look at the Sangean PT-80 ProTravel, so I assume his comment about me needing psychotherapy is because I did not take his recommendation.

David (and others), how does the PT-80 compare to the Degen/Kaito 1103 with respect to MW and SW reception performance?

I save quite a chunk of change going with the 1103, plus the 1103 is a little smaller and lighter. Also, my research indicates the 1103's performance in several important categories appears to be better than the PT-80. To me, it seems like a no-brainer.

Comments?

Thanks.

Roger

You said you have an engineering education. I am a graduate of a major university, but in management, not engineering. In my past life, I ran companies that had people from many engineering disciplines. Major corporations in the aerospace field, with test labs, calibration labs, etc. If I had questioned every paragraph in every text book during my entire education, I would never have graduated. I would still be trying to second guess the authors.

I have a friend who has an BSEE from Cal Poly and an MSEE from UCLA. He is a brilliant engineer and former ham who has owned two electronic companies. If he told me that I should attach my radio to my battery I would just do it. I would not ask him for all the engineering reasons why that is a good idea. I might question him out of curiosity, but I would still accept his knowledge as fact. That's where the authority comes in. If you can't accept hundreds, if not thousands of engineers who would tell you that it is not optimum to attach your radio to the alternator, then you will probably never get anything done in your life. You will always be questioning everything and never accepting the written works of recognized authorities in the field.

Dick

> >I have read through this page, and it contains what you say it does. Unfortunately for my education, the manufacturer's recommendations do not give any reasons for their recommendations, so you have no way of knowing if it makes the radio work best, or just protects the automotive electronics most from interferrance from the radio, or even if they thought much at all about the question, but just gave the first answer they thought of. I doubt very much that they are at all concerned with your radio working, optimally.
>
> You said you have an engineering education. I am a graduate of a major university, but in management, not engineering. In my past life, I ran companies that had people from many engineering disciplines. Major corporations in the aerospace field, with test labs, calibration labs, etc. If I had questioned every paragraph in every text book during my entire education, I would never have graduated. I would still be trying to second guess the authors.
>
> I have a friend who has an BSEE from Cal Poly and an MSEE from UCLA. He is a brilliant engineer and former ham who has owned two electronic companies. If he told me that I should attach my radio to my battery I would just do it. I would not ask him for all the engineering reasons why that is a good idea. I might question him out of curiosity, but I would still accept his knowledge as fact. That's where the authority comes in. If you can't accept hundreds, if not thousands of engineers who would tell you that it is not optimum to attach your radio to the alternator, then you will probably never get anything done in your life. You will always be questioning everything and never accepting the written works of recognized authorities in the field.

Thank you for describing your approach to and qualifications for taking part in a technical discussion. If you only have access to authority, and little understanding, I guess that is what you go with.

But I have always wanted to know the actual reasons why, for everything I work with. That means that I have been working continuously on my education, since I took an interest in all things electrical about 45 years ago.   And you are right that it is a lot of work and really slows down my arrival at many decisions. I have to keep going back to the basics and working my way through all the science necessary, when I break into a branch of engineering that I haven't previously covered in detail, even if it is only a variation that alters a few of the basic assumptions inherent in a previous conclusion. Of course, this approach means that I also welcome correction, when it is well reasoned. I jumped into this discussion, not not because I am an expert with endless experience and knowledge, but because my understanding seems to be at odds with the common wisdom. I hope that either I learn something I have missed, or I help to expand a few

people's understanding beyond common knowledge (which is often wrong in
some fundamental way {it was common knowledge for a very long time
that the Earth was flat} or over simplified). Reality is complicated.

Okay, enough phylosophy. Back to the discussion, please.

I realize I got a bit carried away with my "nevers" there. Thats what
happens when you type and then go back and edit (or try to).
OK...present company excluded, I stand by my statement.

So what happens when the fusible link fails and the alternator does not
see a battery at the other end? Is there a voltage spike that could
damage equipment?

Another advantage is not electrical in nature, but pure common sense. I
am fusing my leads close to the power source. With todays vehicles
engine compartments crammed full of compressors, pumps, drive belts,
pulleys, etc, why would I want to dig down in all of that stuff, when
most battery or power points are sitting right there in easy reach?
My wife's car, she just sold, is a 1996 Monte Carol Z34. As I recall,
you had to take one of the front wheels off, to access the alternator.

Some vehicles I see today have factory installed power points under the
hood, specifically for any aftermarket accessories.

> So what happens when the fusible link fails and the alternator does not see a battery at the other end? Is there a voltage spike that could damage equipment?

Quite possibly, including the equipment that runs the automobile. This fault is expected onlt if the alternator short circuits. The fuse link is generally quite robust and only fused by a short across the battery, through it.

> Another advantage is not electrical in nature, but pure common sense. I am fusing my leads close to the power source. With todays vehicles engine compartments crammed full of compressors, pumps, drive belts, pulleys, etc, why would I want to dig down in all of that stuff, when most battery or power points are sitting right there in easy reach?

I admit that doing it right may not be the most convenient way of doing it. And I have no problem if you do it the convenient way, instead of the best way, as long as you understand the compromises you are making.

> My wife's car, she just sold, is a 1996 Monte Carol Z34. As I recall, you had to take one of the front wheels off, to access the alternator.

Ugly!

> Some vehicles I see today have factory installed power points under the hood, specifically for any aftermarket accessories.

How sweet of them.

I knew that - what is the *quantitative* difference between the
voltage at the alternator and the voltage at the battery?

Oh goody, we get to play the voir dire game, the one I love to do with opposing-side "experts".

Where did you get your degree?

In what states are you a Registered Professional Engineer?

What is your experience in fixed and mobile power system design?

How much experience do you have in hands-on installation, testing, and evaluation of such power installations?

This doesn't even get into question of whether your scheme is accepted best engineering practice in the industry.

Do you accept that the world is round or are you prepared to explain why Christopher Columbus' fourth ship fall over the edge?

My qualifications are a matter of record in the industry. Are yours?

>Agreed. But I prefer to design and install my own alternator RFI
>filter, rather than depend on the battery for that purpose.

The battery is not there to filter RFI - it's there to smooth out any ripples in the rectified but unfiltered alternator output in the AF range. AFAIK no automotive alternator has any internal filtering, and the battery is the best way to provide that filtering as compared to conventional lumped-constant LC filters.

With that attitude towards industry standards including such things as electrical codes which definitely are in the "do it that way because we say so" category, you wouldn't last a week working for me.

How well I know that !!! I've always had a "side job" outfitting public safety communications command posts.

>FWIW, I own a 1995 Ford Explorer which I bought new. About 2 months
>ago, I finally replaced the original factory battery.

Ten years on the original battery? What's your secret?? !!

Conventional wisdom backed up by experience says that a "X-year" automotive battery is not expected to last more than that time if it even makes it to that point. I've replaced a lot in family and "work" cars. I even have to replace my gel-cells - which are on continuous float per manufacturers specs - every four years whether I am ready to do so or not.

>Even though the battery was still able to start the car, I noticed it
>seemed sluggish occasionally and figured that was my "warning".

The "warning" that most of us heed too late. I have the AAA Road Service on speed-dial but I would rather not use it!!

I used to have a VW Bug (the original, not the latter-years "wannabe") where those symptoms usually meant it was time to replace the starter motor brushes. I found out the hard way that "refurbishers" usually only replaced the one brush that was worn so I started replacing both myself and problems went away.

>I have a VHF/UHF 35-50 watt mobile radio as well as a 100 watt HF
>mobile radio in it. Both radios are wired directly to the battery and
>fused on both leads.

Have you considered a dual-battery system through a battery isolator? Leave the automotive loads on the auto battery, and put the radio loads on a deep-cycle marine battery (don't use a gel-cell -- they can't stand the heat build-up under the hood or inside a vehicle parked in the sun). In all the communication vehicles which we have constructed, we install professional vehicle alarms (not the usual "screamers") running from this second battery which is installed in a difficult-to-get-to protected area of the vehicle. We do this even if there is an auxiliary AC generator installed.

Have fun.

The battery is definitely a part of any alternator filter. But
putting a good high frequency capacitor right on the alternator output
terminal to the case, and an inductor rated for full alternator output
current between the alternator and distribution system (to which the
battery is connected) and a second RF bypass at the distribution
branching point, back to the alternator case, to block any RF leakage
exiting the transceiver supply leads from getting out into the wiring
harness, provides a huge reduction of rectifier recovery generated RF
(through both the transceiver power leads and from direct radiation
from the wiring harness) and 3 phase rectification generated ripple.

That is my run on sentence for today.

The battery is the low frequency part of the output capacitor in this
pi filter.

It just seems strange to me to invest all that money in a powerful
transceiver and a custom installation and skip these three vital parts.

How am I to know either the branch wiring resistance between the
alternator and the battery in your car, or the current you intend to
draw from the battery while the alternator is running?  Some have been
talking about drawing more current than the alternator can supply.

I spent 27 years in the (volunteer) fire service and been out many a night on an alarm, mashing down on the floor button, watching the headlights dim....and that was with the heavy duty truck batteries and the heavy alternator. Had a few occasions when the "Q" relay or foot switch stuck "on". I found that quite annoying.

I have even seen a "Q" take the voltage down far enough for the radio PLL to unlock.

I wish I knew. I was very suprised myself. Perhaps it was a very robust battery, or maybe my electric system is set "just right".

Now THAT is stupid!!(not you....the rebuilders) When you have anything torn down to that degree and just replace ONE expendable component when a very minor cost would let you replace both (or all). Kinda like rebuiding an engine and only replacing the rings on ONE cylinder. When you stop and think about it, both brushes have exactly the same amount of time on them (assuming a new motor), so it would stand to reason, the other brush wouldn't have much more time to go before it failed also. Of course, perhaps the rebuilders may want to get you in to charge you a second rebuild charge in 6 months or a year.

I have not considered a dual battery system. I think my setup is basic
enough I can manage OK without a dual system, but I can certainly see
some advantages in certain applications (RV, Mobile Command Posts, etc).
I think I would have a difficult time finding a place under the hood for
a decent marine battery.

I am not arguing that the answer to any or all of those questions is
why you should consider my proposal.  I only mentioned my degree as
part of the explanation of why this discussion interests me.

I am giving a physical argument to support my opinion.  It may not be
correct, but it is an actual argument.

>     Do you accept that the world is round or are you prepared to
>     explain why Christopher Columbus' fourth ship fall over the edge?

I accept that the world is round, because I follow the observations and
logic that have made that the only supportable opinion to have.

>   My qualifications are a matter of record in the industry.  Are
>   yours?

Do those qualifications mean that you cannot ever be wrong about
anything technical?  Are your qualifications the entirety of your
argument, or do you have something specific and physical to add?

I think I would rather have my expensive aftermarket electronics on the battery side of the fusible link.

```

I see no compromise. The purpose of fusing a lead close to the source is for protection against a short circuit and fire. If the fuse is buried down in so much mechanical equipment you can't easily access, it starts defeating its own secondary purpose of ease of replacement while providing protection. If you fuse a lead close to an alternator that is buried down in an engine compartment that requires 2 hours labor and a handful of wrenches, then that is a poor installation.

Which is why I paid a garage to do it. As I recall, I think they even had to loosen an engine mount and jack the engine up some....its been quite a few years and I'm a bit foggy on some of those details, but I remember it was NOT something I wanted to attempt.

Agreed. Perhaps the design engineers are listening after all.
One thing I have noticed with the vehicle interiors. The ALL seem to have dashboards and center consoles that join together and make for the actual mounting of a radio quite difficult. Not nearly as easy as when you could just hang a bracket under the dash. For this reason, I have been accumulating various separation kits, etc, for my radio(s). I think it would be much easier to mount a control head and remote the main unit in some of the newer vehicles.

So you are fine with people who who work for you, doing illogical
things they don't understand, without question, as long as it
corresponds with your interpretation of the authorities. Don't expect

me to come to you looking for work. I get paid to think.

The National Electrical Code goes to considerable effort to explain why its rules are logical and reasonable, and based on sound scientific principles supported by wide application experience. If you study the code, it is very difficult to find totally arbitrary or unexplained rules. The code is a great study in applied electrical physics.

Great. You have prioritized the potential problems and put this one at
the top.

I can see where a burried alternator might shift your priorities. But
the normal power distribution point is not buried, but readily
accessable.

(snip)

Just goes to show that every generalization is wrong, somewhere.

Have you ever appeared as an expert witness? Qualifications are
"job number one". I get my jollies blowing opposing "experts" out
of the water. Most don't know what hit them when they realize that
in addition to bring a communications attorney, recognized as an
expert in the field, I'm also a Professional Electrical Engineer,

recognized as an expert in that field as well,.......I do my job
rather well and I can't/won't be snowed in either field.

Enjoy your world.....

Yes...my engineering partner (and legal client) is on the committee
that drafts the NEC, and he has the same attitude about folks who
won't follow the code "no matter what" that I do.

Anyone need a nice D-104 Night Eagle with preamp before it goes to "that
other place"
$40 + actual shipping costs from 11030 (around $7 USPM with conf)
USA 50 only

I apologize for giving you that false impression.
This group appears loaded with those, and has no need for another.
I was being a person who had an opinion for some particular and stated
reasons, and was challenging this group to show me my mistakes.

No joy, so far.

What I have gotten is lots of "Thats not the way we do it.", "That's
not the way the experts say to do it." "You are wrong." and "I know
more than you do."

But back to your question, I assumed that you are qualified to measure
the wiring resistance between your alternator and battery and also
calculate (or read the manual for) the supply current of your radio,
and know ohm's law. So you should be able to tell me the difference

in the voltage between your alternator and battery. You might also
estimate what the ampacity of that branch wire (with fusible link) is,
based on the wire gauge of the link. If that current is anything near
your radio's draw, you might worry about operating your radio through
that link, especially right after starting the engine, when the
battery is recharging through it, also. Replacing that piece of wire
is an onerous task in many cars.

So nice for you!

Well, that is one hypothetical problem with my suggestion that doesn't apply to those 3 or 4 vehicles. Perhaps car makers have had to reduce alternator noise (e.g. use soft recovery diode bridges) to serve the built in receivers and all the other electronics.

I have never seen it recommended to connect a radio to anywhere but at the battery terminals. Even if the radio were to be connected to a junction box designed for this purpose some distance from the battery you never want the alternator to connect to that same junction. Having anything connected to the wire carrying alternator current will induce noise into that power line due to the resistance of the alternator charging wire.

Most wires coming from the alternator to the battery are rather small, #10 or #8 wire at best. There is significant voltage drop in that wire. The noise from the alternator is not just from the average current causing a voltage drop but from the peak current which is much higher.

Every time you turn on the headlights the noise will get worse if the radio is connected directly to the alternator because of additional voltage drop on that line.
If there should be a break in the alternator wire to the battery the surge from the alternator will most likely damage the radio.

The alternator regulator most likely would not be able to handle the rapidly changing load of an SSB radio smoothly causing additional spikes as it tries to regulate.

Need more reasons? :>)

A more common problem I'd be concerned about would be "load dump", which occurs when a high-amperage load on the car's electrical bus stops drawing current abruptly - for example, if the headlights are switched off while the engine's running.   It's common for this to result in a large voltage spike out of the alternator, before the regulator has time to reduce the alternator output. Spikes of several dozen volts are common - my recollection is that auto-electronics manufacturers engineer their devices to be able to stand 50 volts at their power-supply terminals for a brief moment.

I would expect that the magnitude of this spike would be significantly greater at the alternator terminals, than it is at the battery, due to the series resistance and series inductance of the battery-to-alternator cable, and the battery's low impedance. It's possible that a load (e.g. radio) which could survive a load-dump spike if wired to the battery, could be damaged by a higher-amplitude spike from the same load-dump event which might occur right at the alternator.

It seems clear that the standard, recommended practice is to wire radios to the battery. It also seems that the original poster is not satisfied with the justification for this practice (either by convention, recommendation of authority, or theoretical arguments posed to far), and that he has some arguments from first principles which he feels justify a different approach (wiring to the alternator).

In the end, for the original poster to be satisfied (either that standard practice is the best practice, or that his alternate suggestion of wiring directly across the alternator is actually superior) I suspect that he's going to have to fall back on that old mainstay of scientific discovery - he's going to have to experiment.

He'll have to wire several different radios, of various makes and models, up to [1] a double-fused heavy-gauge feed from the battery posts, and [2] an equivalent feed brought back to alternator and its ground. He can then determine whether his alternate approach actually delivers more useful current to the radio, whether the transmitter powers are actually higher, whether there is indeed more alternator whine or RFI on the transmitted signal or the received audio, and whether the radios show any differential in their ability to survive a few months of usage and load-dump spikes without losing their Magic Blue Smoke.

Actual results (either way) trump speculative arguments.

I know of a guy who had an HF radio fry when the voltage to it exceeded 16 VDC - not once, but twice - doing some major damage (a few parts and lots of dollars). He didn't know what caused it the first time to protect it before the second. He thought it was just a fluke (the first time). The point is, anything beyond the rated 13.8 was running a risk - even if accidental. And as argued in previous posts, the whine coming straight from the mother of it - has to be a bear.

I would like to know - where this idea hails from - to begin with, how long "John" has been doing it, how many radios and/or alternators fried from it.

Also, I don't think any or all of us are saying we're all right and you - "John" - are all wrong. It just seems NONE OF US - have ever heard of this being done. WHERE - what book, teacher, etc - got you on the track of doing it this way???? We just all (except you) seem to be in agreement with the way "we" were taught. Maybe you could think of it as say - John Glenn explaining flying a rocket to a cave man. The concept new - unheard of. Not that it hasn't been done - you've said so yourself, ya got to be a good "salesman" to get it across to the masses who've yet to see. You have to know - anything "new" - be it a new drug to fight disease, technique to do surgery quicker and less painless - or Electronics techniques or measurements - will meet resistance until proven.

Maybe - if any of you out there have access to a junk car that runs yet, and

you're not afraid to experiment, can grab some junk (but working CBs/2 way radios) - give it a whirl and report back with your own test results. As Dave Platt said in the post above - "Actual results (either way) trump speculative arguments."
 I don't have a junk car to try it with..... Maybe I'll go to a junk yard and try to pick one up cheap..... try it a few times. I'd love to see how this works - maybe I can become a believer.

It might well have been the load dump phenomenon Dave described. The
cause of load dump is that at any given time, the alternator contains
quite a bit of energy. If a good part of the load is abruptly removed
```

from the alternator, the energy is "dumped" into whatever is left connected to it. The result can be several tens of volts or more, with the capability of supplying a lot of current. A common cause of load dump is loose battery terminals, and this might be what happened to the fellow with the blown rigs. The safest thing is to connect the rig directly to the battery posts, not the connectors or connecting wires. Long ago I bought and built a Heathkit SSB mobile rig, and I recall drilling holes in the ends of the battery posts and (gently) driving in some special terminals that came with the mobile supply.

I'll join the chorus in recommending against connecting a rig anywhere but at the battery, and add my recommendation that the connection be made directly to the posts. As several others have said, the battery does much more than start the car. Without it you've got a very nasty supply with the potential to do serious damage.

Roy Lewallen, W7EL

Take a look at 7384871458..Collins Ham radio??? He says that his grandfather "told" him it was collins. He also says that an experienced Ham would know what he was looking at, A non experienced Ham should not bid ..Thats not the point..Point is, "no where does it say Collins,NOWHERE...A perfect example of buyer beware.. An additional reason to connect to a point with the lowest Thev. equiv. resistance (battery terminals) has to do with turning off inductive loads. A student of mine told me he once measured just over -100 volts on the line to a windshield wiper motor when the motor was turned off at just the right time. (Storage scopes are desirable.) That system was not put into production.

Another story has to do with the turret motor in a tank. When the turret stopped rotating the resultant voltage spike would destroy all of the tank's electronics. (Talk about concentrating one's mind!) The temporary solution - since the problem was discovered late - was to buy huge zener diodes from Delco Radio (as it was then called) and place them across the 28 volt line.

Thank you for discussing principles and effects.

Agreed, that the alternator does not produce pure DC, so the voltage will not be quite as quiet as it is at the other end of the several feet of wire that connects to the battery positive. (But to paraphrase Ceeil Moore's question to me, earlier) Do you have any idea, quantitively how much voltage you are talking about? THe ripple current in the output of the alternator sjhould be a few percent of the DC, at most, with some high frequency pings caused by rectifier reverse recovery.   Adding a rather small PI filter is very effective at reducing all this no a much lower value. And the small charging branch to the battery cuts the other way, also. If you draw significant current from the battery, the battery's voltage is held lower than the alternator voltage by the IR drop of that wire. And that drop lowers the charge state of the battery.

> Every time you turn on the headlights the noise will get worse if the radio is connected directly to the alternator because of additional voltage drop on that line.
> If there should be a break in the alternator wire to the battery the surge from the alternator will most likely damage the radio.

Now, you may just have hit upon the one factor that trumps every other minor effect. Unfortunately, the most common cause of load dump voltage damage to automotive electronics is caused by a loose battery terminal. So, till you solve that problem, you are not gaining much insurance by moving your connections to the battery terminal.

> The alternator regulator most likely would not be able to handle the rapidly changing load of an SSB radio smoothly causing additional spikes as it tries to regulate.

Is any radio not equiped with input bypass capacitors? I am skeptical. If this were the case, the radio would not tolerate feet of wire in the power circuit. Do you have a schematic of any DC powered radio that does not show some storage at the DC power input?

Again, we are not talking about powering from an alternator with no battery attached (except for a terminal comng off the battery), only moving the power point to the other end of the battery charging branch wire (that 2 or 3 feet of 10 gauge wire you mentioned earlier (with, possibly a fuse link section in it) so that the average current arrives from the alternator, and only a stabilizing effect on the ripple arrives from the battery through that wire.

> Need more reasons? :>)

Who knows?   If you got 'em, I am happy to think about 'em.

I want to thank you, again, for taking time to think (in print) about what is going on in this system and what can go wrong. This has been helpful.

Icom to linear amplifier cable, that protects the Icom Pro transceivers internal relay, Made by W2ENY. This cable plugs into the accessory (ACC 2) rear jack (DIN type) on the Icom Pro series and has 4 feet of shielded cable and an RCA/Phono type plug for your amplifier. The cable has a relay in it, the contacts are rated for 2 amps DC and 0.6 amps AC. Mailed to you for $25

>
> A more common problem I'd be concerned about would be "load dump", which occurs when a high-amperage load on the car's electrical bus stops drawing current abruptly - for example, if the headlights are switched off while the engine's running. It's common for this to result in a large voltage spike out of the alternator, before the regulator has time to reduce the alternator output. Spikes of several dozen volts are common - my recollection is that auto-electronics manufacturers engineer their devices to be able to stand 50 volts at their power-supply terminals for a brief moment.

This is an effect that is well worth discussing and understanding, thoroughly.

The load dump (with battery connected) would be a very slight thing, if the alternator could react instantaneously to load changes. But like any feedback control system, it has a maximum frequency that it can react. The electronic excitation regulator is quite fast at detecting the slight rise in system voltage following a load reduction (headlights turned off), but the magnetic field around the rotor takes more time to decay after the excitation regulator decides to cut its current. During that time, the alternator ramps its output current down from what the load curent was before the dump to what it is after the dump. So there is a few 10s of milliseconds when the battery has to absorb the extra current. And that pushes the voltage across it up.

The opposite effect occurs (and worse because ocold filaments draw almost 10 times the normal current) when the headlights are first turned on. There is also a wiring system inductive effect that adds an additional but very brief (microseconds) peak to each of those excursions.

> I would expect that the magnitude of this spike would be significantly greater at the alternator terminals, than it is at the battery, due to the series resistance and series inductance of the battery-to-alternator cable, and the battery's low impedance. It's possible that a load (e.g. radio) which could survive a load-dump spike if wired to the battery, could be damaged by a higher-amplitude spike from the same load-dump event which might occur right at the alternator.
>
> It seems clear that the standard, recommended practice is to wire radios to the battery. It also seems that the original poster is not satisfied with the justification for this practice (either by convention, recommendation of authority, or theoretical arguments posed to far), and that he has some arguments from first principles which he feels justify a different approach (wiring to the alternator).

I want to understand why the recommended way is best, all things considered. I see some positives and some negatives, and judged, on balance that the "normal" way was not necessarily the best way. But, the load dump factor may outweigh all the others, if it causes damage. I'm not so sure it does, but this diuscussion is helping me weigh it.

> In the end, for the original poster to be satisfied (either that
> standard practice is the best practice, or that his alternate

> mainstay of scientific discovery - he's going to have to experiment.

All the principles involved should include only known science. As long as I don't miss anything, the probvlem should be solvable without reinventing electrical principles by experiment. But a few accurate measurements of the voltage spikes at both the battery terminals and DC bus distribution point are probably not a bad idea, in any particular car.

Thank you for supplying an important missing piece of this puzzle.

I would add that if your battery starts to get a little flakey and the voltage is sagging pretty low during starting, you can have a large increase in the load dump voltage at the battery, even if you have made the seperate connections you describe, just because of the increase in the battery impedance.

One of the most common electrical system problem in cars is loose battery terminals, and I'll bet not one person in a hundred, that installs separate leads to the battery, terminates them as you describe. So when I hear stories of a load dump causing damage, I always wonder about how clean and tight those terminals were.

I replaced my original equipment GMC pickup battery with
a Sears Die-Hard with four ternmials. Two of the terminals
are the standard GMC terminals on the side and two of the
terminals are old-style posts on top. I tie my transceiver
to the two posts on top.

Neat idea!

I've noticed that some of the Optima batteries (e.g. the blue-top dual-application type) come with two sets of battery posts - standard car-type posts, and smaller (threaded - SAE?) studs. Might be a good idea to connect radios to the threaded studs, using heavy-duty ring terminals on the ends of the wires.

Most radios do not have much for DC line filtering in them. Maybe a
500 to 1000 mfd cap if that. With a current draw of around 20 amps for
the typical transmitter 1000 mfd is not much capacitance at 12 volts.

As to the "load dump" problem, when the radio draw swings from around
1 amp to 20 amps at an audio rate I have to believe that the
alternator regulator would have a hard time keeping up and not
allowing overshoot or holes in the supply current.

Alternator filters can help filter out alternator noise but some times
they fail to do so even when the radio is fed directly from the
battery.

I have one ancient but probably still valid reference to alternator load dump. It indicates that it can be simulated by connecting a 6000 uF capacitor charged to 120 volts to the system. The result is a 120 volt spike with a decay time of several tens of ms. (The reference doesn't show the load current or impedance, but presumably this is with a typical automotive load and wiring system.) It also shows how a so-called "'A' line filter" -- an L network of 200 - 400 uH and 1000 uF reduces the peak voltage to a mere 40 volts but with a stretched decay time. The conclusion is that robust automotive electronic devices should be able to withstand this. I got this from an app note for a National audio amplifier IC which was designed to be used in automotive applications and so can withstand momentary 40 volt spikes.

Roy Lewallen, W7EL

(snip)

If I had a radio that had a 20 ampere power swing through the supply leads at audio frequencys, I would consider it a poor choice to run those power leads more than a few inches without adding some serious storage at the radio end of the wires, just to reduce the IR (reduce peak amps to something closer to average) and inductive drop of the power wires. The same applies to an audio amplifier of similar current draw. It is very common for large audio amplifiers to have serious capacitance at their end of the power wires. This also reduces the peak voltage during a load dump.

This appears to be something that anyone with a saw and a few scraps
could make in half an hour. The "friction" mount and the rough fit and
finish contribute to this impression. What makes it worth $70?

I had the 2000X for several months. Just could not get used to the firmware
after years of Icom. Selecting the RX antenna port was a hassle, no band

stacking registers, filter presets- on and on. Got rid of it and happy again
with a PRO II.

I have for sale an execelent tri band radio that I no longer need.I have
original box,remote cable for the head and I may have original manual for
it.I do know I have a copy of the manual also.This radio has been in my
wifes van and just used mainly as a scanner.So I took it out and replaced it
with a scanner.So now it is up for sale.I am looking to get $375.00 for
it,plus a little help in shipping .And yes it is worth evrey cent.So please
no tire kickers.Either you want it or you don't.Thanks for looking.I can be
reached at 978-281-1339

The ads for the Kenwood TS2000 were not the best.  I thought the same,
ugly.  I bought one anyway because of all the stuff it will do and when
I got it and on the desk it's not all that bad  looking.  The pictures
aren't very good.  It is quite a radio.

As for the MKV, I had one and it's got many on hours, hundreds in fact
and I never had any  problem with mine, but that does not speak for
everybody, just me.  Having said that, I did not find the MKV to be much
better than the MP.  I like my 775 better.

Read the installation manual for the opener. I installed a "Genie" at my
last house. The logic for the wired button and the remote control are
quite different. The door adjusts its speed and torque by learning from
using the wired control. There is a torque sensor which detects
blockage of the door as well. Again read the manual, it could be the
installer does not RTFM!

I once made a service call to Automatic Door in Chicago. They had a
newspaper article on their bulletin board about some unlucky guy who
came home to find his garage door spring unwound. It seems he decided to
fix it himself and while up on the ladder he got his necktie (another
good reason to ban them) caught in the spring as it wound itself up. His
wife tried to cut him down with scissors but was too late..

Good point!

I recently had a spring break in our 1960-vintage rolling door
setup... the door wouldn't even start to roll up with only one spring
out of two providing proper tension.

The repairman who came out and replaced it, said that he gets a
significant percentage of his business from people who first tried to
do the repair themselves... and decided to call him after they got out
of the hospital.  The most common injury seems to be a broken
collar-bone.  Those springs are under a *lot* of tension.

Let's forget about the door, its springs and torque adjustments. This is an RF problem! Neither a new remote nor the original remotes will actuate either the new receiver or the old receiver. Has nothing to do with the door itself or the closer. There is something near that physical location that prevents the receivers from getting a valid signal from the remotes. I am looking for ideas as to what that might be. This is an all-house neighborhood. No businesses of any kind. Nearest thing other than houses is a high school two blocks away. Power lines are overhead, not buried.

I think you're going to have to find something that's capable of acting as a spectrum analyzer (or at least a crudely-tuned RF sensor/signal-strength-meter) and start DF'ing.

A ham HT with 70 cm capability, and a 'scan' feature, might be enough to find the signal frequency fairly quickly if it's strong enough to interfere with Part 15 devices. Then, start hunting. A simple hold-it-near-the-chest-and-spin-on-your-heels 'body fade' might be enough to allow you to triangulate in on the source.

A two- or three-element Yagi hooked to a real spectrum analyzer would probably be rather faster.

I agree with you Dave. I have everything that would be needed to trace out the interference. Unfortunately, I live 500 miles away. I am trying to find ideas that I can offer to my 80 year-old aunt that she can use in discussions with service people, utility companies, etc. She is still very sharp, but lacks electronic experience.

Dick

I think you speak of the Ten Tec Scout 555, which was the 50 watt radio, or the Argo 556, which was identical, only just 5 watts.

If it is interference it could be from a number of different sources &

finding that source without the right equipment (most garage door companies won't have this equipment) can sometimes be difficult.

Over the years I have seen interference from police scanners, ham radio's, large satellite dishes when pointed in a certain direction, cell phone towers, when a particular car was parked in the driveway (believe the interference was from the car alarm), and other garage door openers. Usually all of these items are relatively close to the problem location. I have also heard but never seen that a TV cable will also cause interference if not poperly grounded.

Within the last couple of years the military has been installing new radio equipment that stomps all frequencies in the 375-450 range and there are reports that this interference can range up to fifty miles from the military installation. For years the Chambelain, Liftmaster, Craftsman, Genie and others have been usuing the 390 frequency because of it's reliabilty before these new installations. Last spring the Chamberlain group of openers started using the 315 frequency to get away from this interference problem. I don't know off hand what Genie has done to remedy the problem.

About 6 months ago, most of Aruba started having interfernce problems quite suddenly (no one there knows where it is coming from) and the 315 frequency solved the problem there also.

With all of that said, as others have posted interference will not usually stop a closing door in mid travel. There may be some other issue there or it may be that your aunt is holding the button too long when she can't get the door to work & the opener actually ends up receiving more then one signal from the transmitter.

Usually for a door company it is easier to install new radio controls that are on a different frequency that will work in a certain area then it is to find the offending source. If it is a military installation, phone tower, etc there isn't a whole lot (if anything) a door company or a homeowner can do to stop the interference from happening & the only choice is to come up w/ a work around. It may sound like a cop out or bs excuse but as we produce & use more products that work on radio frequencies the interference problems are only going to continue to get worse. Therefore until someone comes up w/ something different or better we must learn to deal w/ it effectively & the best way to get the consumer a product that will work as it's designed.

Ten-Tec Scout. 50 watts, with a fairly popular aftermarket mod to provide a switchable 5-watt setting for QRP operation. PTO tuning, with a reputation for being a bit drifty over time especially during CW operation.

In my experience it's a pretty decent little radio - I have one in my Aerostar for HF-mobile operation.

It's no longer being manufactured, but Ten-Tec still sells the band modules and has some stock of replacement parts for it.

Thanks doordoc. That's what I was looking for. My aunt's door is not the one with the open halfway then close problem. That's across the street.. My aunt's won't operate at all with the remotes. The house beside her has the same no operation problem. I don't know how far this problem spreads in the neighborhood. She has already paid the original installer $120 to troubleshoot. The installer is convinced it is an interference problem. I am going to try to find out the make and model to see what I can learn about frequency, etc. If I can find out, I will post it here for comments.

Dick

Hey,

I am trying to find out the different Node numbers for repeaters worldwide. My local 2m repeater is enabled for gettin other repeaters worldwide as i have heard it beind done many times. Is there a website that has the numbers or would one of ye be kind enough to provide me with the info.

Thanks,
Chris

<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5857659690>

Less than 3 days to go...

Available on eBay is a complete set of Motorola MX350S Synthesized, DES

Encrypted VHF radios. The system comes with a six position charger/conditioner, batteries, manuals, RF test cable AND a DES Keyloader. Because this system uses DES Encryption, it can only be shipped to a U.S. address.

See eBay item #5857659690

Thanks,

S

Phil Kane wrote:

> HUH???? I've designed enough communication site power installations to know that the battery powers the equipment and the function of the alternator in a vehicle or the rectifier (power supply, in ham language) in a fixed intsallation is to recharge the battery "on the fly", so to speak.

Sorry, I thought we were talking about a vehicle electrical system. In a vehicle, the battery serves essentially one purpose, to start the engine. After that, everything runs from the alternator, which also recharges the battery over a period of time.

> The current capacity of the battery is much greater than that os the charging device.

Are we talking about a transmitter that draws more current than an alternator can supply? If so, I think it is a poor arrangement. I wouldn't connect a transmitter that exceeded the output capability of the alternator, even if it meant I had to upgrade the alternator t oavoid it. I also wouldn't install a tranceiver in a vehicle without adding an RFI filter to the alternator. If it is too noisy to be connected as the power source, then it is too noisy to have connected to the wiring harness, in such proximity of a receiving antenna.

> Any design that puts the load on the charging device rather than on the battery would be rejected out of hand.

Not by me, it wouldn't.

> At best. both of them would be connectable (through switches or circuit breakers) to the load bus, with separate metering for the battery, the charger, and the load.

In the automobiles I have experience with, the alternator connects directly to the power distribution bus with one branch of that bus going to the battery, as the recharge path. The battery also has a heavy connection directly to the starter relay, to start the engine, independent of that distribution system. Connecting a big load, whether headlights or transmitter directly to the battery will lower the battery voltage slightly, so that it does not recharge fully. All loads should branch from the alternator output, where the voltage is regulated, including the battery charging branch.

> In your scheme the equipment would get no power when the alternator is not operating, or more clearly, if the equipment DOES get power, the power must be coming from the battery.
> Think about it.

I'm thinking about it. You are saying that the transmitter draws more current than an alternator can deliver, with the engine running, but

you intend to operate it without the engine running. I hope you pack
jumper cables. ;-)

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Really? Then you should have an alternator which could supply the
starter motor too, with that thinking.

The battery is there as a power source for intermittent loads. Use it.

Have you ever driven a car with a totally dead battery, after starting it with jumper cables and running entirely off the alternator? I have and it's not good. The battery is there for more than just starting the car. It also stores and smoothes the output from the alternator, much like a giant filter capacitor. Don't be afraid to use it as such.

What you are suggesting flies in the face of everything I have ever read on mobile radio installations over the past 55 years. In fact, I would defy you to point to any engineering documentation that suggests attachment of the radio power leads to the alternator vs directly to the battery.

I described the separate wiring that allows large current draw from
the battery, intermittently, for starting.

Of course, you can use the battery in ways the auto manufacturer did
not intend. If you want to run a radio for long periods with the
motor off, you can expect the battery life to be shortened, though.
Auto batteries are not deep cycle designs.

Agreed.  But I prefer to design and install my own alternator RFI
filter, rather than depend on the battery for that purpose.

Dick, I have been wrong lots of times, before, and would be happy to
see valid arguments that shows me my errors, here.  Unfortunately,
arguments from numbers and authority are not valid arguments.  Telling
me that lots of peope dissagree with me is about as persuasive as
telling me that my way is "not acceptable" with no reasons why.

Edumacate me.

Beauty is in the eye of the beholder, I guess.  I think the Honda Element is
one ugly vehicle, but I see a lot of 'em on the road.  My 2000 seems to be
quite a radio for the price.  It does just about everything I want and need
in a rig, and does it all very well.

The difference is the IR drop of the branch circuit from the power bus to the battery positive, including the fuse link in the harness.

Loading the battery for long periods when the alternator is running is likely (if the regulation point is at the power bus, not at the positive battery ternminal) to result in an under charged battery.

If the regulation point is the battery positive terminal, then the voltage at the distribution bus point will be pushed up to compensate for the unexpected IR drop in the battery branch, and will shorten the life of headlight and other bulbs. (The charging systen is designed so that the battery is normally recharged at a rather modest rate, not at the full alternator output capability.) This is a reason why the regulation point is usually at the distribution bus, not at the battery terminal.

I'm not sure it's possible. If I said that every authoritative document I have read since I was born states that the world is round, and you still insist that it is flat, there is nothing I can do to convince you otherwise.

Good engineering practice has ALWAYS said that radio communication power leads should go DIRECTLY to the battery. One document that I would refer you to is the ARRL RFI Book. Direct battery connection is mentioned several times. Engineers at the automobile manufacturers EMC labs recommend direct connection to the battery. If you want to read a detailed discussion on the subject, go here.
http://www.arrl.org/tis/info/rfiauto.html If numbers and authority

aren't valid arguments, then there is no point in trying to educate
you.

Dick

Sure you could, if you understood the basis of the popular belief that the world is round and could explain the facts (observations, measurements. logic) that support that popular belief. That iswhy science is so much more solid than religious dogma. Anyone with the interest and resources, but doubts, can go back to the original experiments and duplicate the observations and measurements that were used to build the logical framework of any part of scientific understanding. If you just study the conclusions and have no knowledge of how those conclusions were derived, you might as well be memorizing dogma.

Thank you. I will see what they have to say.

> If numbers and authority aren't valid arguments, then there is no point
> in trying to educate you.

So you have no understanding of why one way is better than another, except that there is a consensus of someone says so.

At least, I have presented my reasoning. I got an electrical engineering education, so I could wade into such reasoning. It certainly isn't infallible, or complete, but I do my best to think things through, logically, applying physical principles. If my knowledge or reasoning is faulty, tear it up.

I have been watching this message thread and I am in Dick's corner on
this one.

I have never never read anywhere, never heard anyone, advocate
connecting radio equipment directly to the alternator.

One thing, the battery functions somewhat as a big filter capacitor.
The alternator is designed to supply sufficient current so if everything
is going (lights, fan motor, radio, etc) there will be sufficient
current to supply it, however, there are times, such as starting the

car, you need the extra capacity of the battery. In as much as many community water systems rely on storage tanks and do not draw directly the well or stream they draw water from, an automobile battery is a storage device for electricity. The various devices in the car draw off the "storage tank" which is replenished by the alternator.

Adding other equipment such as a transmitter, could possibly overload the alternator. Albeit temporary, the alternator could be strained to its limits, where a battery could easily supply the necessary current on a temporary basis and then get replenished by the alternator.

Years ago, ambulances had the old Federal "Q" mechanical siren. It took several hundred amps to get that thing going. No alternator could handle that. It was not unusual for headlights to dim noticeably when you started the siren. Even today, fire engines, with their beefed up electrical systems, heavy duty batteries, high output alternators, still get their lights dimmed when they start the "Q".

FWIW, I own a 1995 Ford Explorer which I bought new. About 2 months ago, I finally replaced the original factory battery. Even though the battery was still able to start the car, I noticed it seemed sluggish occasionally and figured that was my "warning". I have a VHF/UHF 35-50 watt mobile radio as well as a 100 watt HF mobile radio in it. Both radios are wired directly to the battery and fused on both leads. A few times, I inadvertently left the VHF radio on and over the period of a few days, ran the battery down to the point I had to reset the clock and radio stations. After jump starting the car and letting it run, the battery bounced back to life. I tried not to make a habit out of that, but things happen.

I had considered buying another battery and keeping it in the car, just to see how long the original battery would last, but it would be my luck, the time it crapped out, would be the time I needed to get somewhere in a hurry. I figured the original battery didn't owe me a thing.

I am with Dick on this one too, with ONE change, I have a dual battery
setup. One is for the truck system, the other is the one I use to power
my radios, and extra equipment(laptop, and networking test equipment).
This way you will never run down your starter battery, and the equipment
battery is a deep cycle dual purpose marine battery...

I have read through this page, and it contains what you say it does. Unfortunately for my education, the manufacturer's recommendations do not give any reasons for their recommendations, so you have no way of knowing if it makes the radio work best, or just protects the automotive electronics most from interferrance from the radio, or even if they thought much at all about the question, but just gave the first answer they thought of. I doubt very much that they are at all concerned with your radio working, optimally.

Further down in the discussion section, the manufacturer's recommendations are echoed several times, but the reasons given are related to avoiding specific problems. So here is whai I found:

(begin excerpt)

Q: When I'm installing the radio, where should I connect the dc power leads?

A: The positive and negative leads from the transceiver should connect directly to the battery with fuses in both leads. Route them away from any
other wiring in the vehicle. This usually means drilling a small hole in the
firewall between the engine and the passenger compartment and running the
wires through a rubber grommet (to protect their insulation from sharp edges). If the wiring or antenna lead must pass near vehicle wiring, route
it at right angles to the wiring. It is best to run the power and antenna
leads as close to the vehicle chassis as possible.
(end excerpt)

This is essentially an echo with not much reasoning. Do it this way because (they, we) I say so.

(begin excerpt)
Q: Why can't I find power inside the ear?

A: It's often difficult, especially in modern cars, to know which power sources in the passenger compartment can safely carry the high-current loads of a transceiver. If you choose a source that also powers one of the microprocessors, the transmit current could cause problems. In addition, some transmitters are not well bypassed and some RF energy can appear on the power leads. This is bad news for microprocessors. Even grounding isn't as simple as it seems. With all of the plastics used in modern vehicles, not everything that looks like ground is really ground. It could be "floating" or even be part of the wiring for one of the vehicle's sensors. Even if you do tie into the chassis, it is possible that the section you've chosen forms part of the return path for one of the control modules Generally, you're better off running the wires to the battery, especially for high-power installations.
(end excerpt)

Now, here we have a couple reasons why it is not recommended to just tap into the existing power distribution wiring.

1. Exceeding ampacity of the wiring.

2. RF leakqage out the radio power wires interferring with the automotive electronics

3. Chassis as ground return coupling noise between radio and car electronics.

All good points. None contradict my idea, except, possibly 2. But the RFI filter I suggest adding to the alternator can bypass this noise. Beefing up the noise immunity of the power bus seems like an excellent idea if you are going to add a powerful RF generator to any modern vehicle, whether the radio requires it, or not.

(begin excerpt)
Q: My VHF installation works perfectly. However, I followed similar guidelines for HF and found that I had some pretty strong noise on receive. Some of this noise goes away when I connect the radio to the test battery I used earlier. Any ideas?

A: It sounds like some of the noise is coming down the power leads. To cure this, first try ferrite chokes on the positive and negative leads. Obtain two FT-140-43 ferrite cores [2] and wrap about 10 turns of each wire onto the core. (Fewer turns may not work, and if you substitute a different ferrite, make sure it's suitable for HF - unknown materials usually don't work!) You can also try installing 0.01-uF capacitors from the positive lead to the negative lead, or from the positive lead to chassis ground (or both). The capacitors may work best with or without one or both of the ferrites.
(end excerpt

This is a very brief discussion of filters between the power source and radio. I would like to see a much more scientific expansion of this topic. There are lots of things to know about making effective, high current RiI filters, especially ones that must carry large DC currents. It does imply that a battery is not necessarily an effective bypass capacitor at RF frequencies.

I still see nothing about why it is so important to connect directly to the battery, instead of to the power source that maintains battery voltage, except that people say to do it. It is beginning to look like common wisdom that may actually be based mostly on a commonly held myth.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Depends on whether the battery is fully charged or not. Immediately
after starting the engine, the voltage difference will be at its
greatest. After a few minutes running, the difference will be very
small, unless a large current drain is occurring.

In other words, there is no single answer.

nitespark wrote:

> I have never never read anywhere, never heard anyone, advocate connecting radio equipment directly to the alternator.

You can never again say that, honestly, since you have seen me advocate, exactly that.

Oh, you mean anyone you trust. Okay, never mind. ;-)

> One thing, the battery functions somewhat as a big filter capacitor. The alternator is designed to supply sufficient current so if everything is going (lights, fan motor, radio, etc) there will be sufficient current to supply it, however, there are times, such as starting the car, you need the extra capacity of the battery. In as much as many community water systems rely on storage tanks and do not draw directly the well or stream they draw water from, an automobile battery is a storage device for electricity. The various devices in the car draw off the "storage tank" which is replenished by the alternator.

The alternator and battery are connected by a piece of wire (often including a fusible link to act as a fuse, in case the alternator rectifiers short, to prevent fire).

The battery can act almost exactly the same as a reservoir from the far end of this wire as it can with a more direct connection. The difference being that a direct connection lowers the effective charging voltage by the amount of the connecting wire IR drop while the radio is drawing current. If the radio is connected at the alternator end of that wire, the alternator and battery provide current to the radio through two parallel paths, rather than the total radio current having to pass through the alternator-battery link. If the alternator regulation keeps up with the radio load, the battery will provide nothing except for ripple filtering, and stay fully charged.

> Adding other equipment such as a transmitter, could possibly overload the alternator.

The alternator provides the current, whether the radio is drawing it through the battery charging branch or not.

> Albeit temporary, the alternator could be strained to its limits, where a battery could easily supply the necessary current on a temporary basis and then get replenished by the alternator.

(snip remaining personal account that addresses other problems)

The alternator and battery are connected together by a fraction of an ohm.   The alternator doesn't appreciate the difference (of where the radio is connected). The battery and radio might.

I use the through hole in the floor of my Ranger [Ford] as you describe.

Coax should have no rf current on the outside of the cable assuming a
good ground at the antenna.

~~~~~~

Nonsense.

Current on the outside of the coax is caused by imbalance in the
antenna. A good ground will not get rid of it, in fact it may well be
the cause if the ground has a different impedance than the antenna.

Find aVE in your Area.
Tech PLUS (someone who was a 5 WPM morse Novice who upgraded to Tech by taking the General class test), only needs to do some paperwork at a VE test session.

FS: REAL NICE HAMMARLUND HQ180

Great cosmetic and electrical shape, just realigned. I am presently using this receiver on on 75/160M AM. Plays great, looks great. Has been retubed, old/defective components replaced, and cleaned. Tested from 540 khz to 30 Mhz and it pulls in signals as well as an FT1000MP sitting next to it. Stable and calibrated. On AM it has better selectivity and audio than the MP. On sideband it sounds good and has minimal drift. Has aftermarket clock, includes manual. Looks every bit as good as the pictures (which will be emailed on request).

Price is $425.00. I prefer not to ship this, due to risk of damage by carrier. I am in the Kansas City area and will drive 100 mile radius to meet buyer. I will ship if you insist, but cost of double boxing, packing materials, and freight charges are responsibility of buyer. I do not intend to make money on the packing/shipping, just want to make sure the item arrives at your location without damage or hassles!

I also have the matching S200 speaker (sounds GREAT) in equally good cosmetic/electrical condition. Inquire if interested.

Send me your email address and I'll send photos and answer any questions.

Show up at some event (club meeting/hamfest/a pre-announced gathering)
that has made it clear that Volunteer Examiners will be giving tests to
those who wish to upgrade on XX date.  Bring a copy of your license plus
the original, bring the fee for testing/don't forget your birth
certificate and picture ID card.  Study.  Good luck.

If you received your Technician license prior to 1987 (I think the cutoff data is sometime in April 1997), then all you have to do is bring proof of that to a VE test session, fill out the upgrade application, pay the processing fee and that's it.

If you received your Tech Plus (at times called Tech with code instead of Tech Plus) between 1987 and the restructuring of April 2000, you will need to bring proof of that to a VE test session, pay the fee, take and pass the General written test, and fill out the upgrade application.

If you received your Tech with code after the cutoff date in April 2000 and your code CSCE is more than a year old, you will have to take and pass the code again and take and pass the General written. If your code CSCE is less than a year old, you will only have to take the General written. Of course you will need to have the original and a copy of the CSCE.

For all paper work, take both the original and a copy. The VE team will need to have the copy to attach to the paperwork filed with the VEC.

I have one of these boat anchors along with manual. On the off chance that anyone would want it, let me know before I start dividing it into pieces compatible with trash collection...

Dan Lanciani

Bill, the discussion is about a MOBILE installation. The antenna is end
fed against ground, not a balanced dipole type.

What bands and power are you running? 40 through 0.7 meters at full
IC-706 MK IIg output [100 watts on HF, reduced on VHF/UHF]

Where is your antenna mounted? OHF on the bed wall near the tail gate.
VHF/UHF on the cab window.

Ever had any malfunctions caused by RF? NOPE!!

Thanks.  Your installation is almost identical to mine:
-- FT-857, 100 watts on HF, 25 or so on VHF/UHF
-- Antennas mounted on the rear corners of the bed, in the rear stake holes.

I'm using double-braid RG-8X.

It would help if you told us where you were located. The state and city would be enough for someone to point you to a local ham or club that could help you.

I have a nice die-cast Radio Shack bookshelf speaker I bought probably 15 years ago that I use on my SW/Ham radios. It's not a perfect speaker but it's fairly mellow, not at all tinny, and extremely durable.

I think Radio Shack sold them as outdoor/patio type speakers when I bought them and I seem to recall the name "Minimus-7".

I go to look at Radio Shack and they don't have anything like this anymore. They've got some really crappy plastic-tinny sounding speakers that I don't like at all, and would probably break the first time I looked at it funny.

What speakers are available in durable die-cast housings these days? And I hate tinny sound (like comes out of a PC-clone speaker). I refuse (just out of abhorrence of the sound) to look at any PC or PC-with-amplified-subwoofer crap speakers.

Did I mention that I don't want any PC speakers, and they all sound awful? (Hint, hint, DO NOT SUGGEST THIS OPTION!)

Tim.

I agree, the Minimus 7 speaker worked very well for shortwave listening.

There are several Minimus-7 speakers on Ebay right now. I just
looked.

~~~~~~

I'm well aware of that. A 1:1 choke type balun at the antenna feed
point will make it a balanced system and the RF on the coax problem
will vanish.

Bill, W6WRT

I have for sale a Kenwood TM-201B 2 Meter MobileTransceiver. It is in nice
shape and comes with the
Mobile Mounting Bracket, the Kenwood Touch Tone Mic, the Kenwood Mobile
Speaker, the Power cable, and the Original Manual. It runs 45 watts of FM or
as low as 5 Watts. No Tone Board.Price is $55 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

You can find minimus-7's and 77's on eBay. I
found a couple at a yard sale last year. If you
find one and you want to upgrade it a bit,
you can go to partsexpress.com and you
can find a project there that someone did to
replace the drivers in the minimus-77's to
achieve better sound.

Buy a system like this at the thrift shop.  Throw away the
electronics, keep the speakers.

Tim, you might also search for the name "Optimus" Same cast Al case and speakers with internal crossover networks. Same speakers as the Minimus, different timeframe. IMHO, neither sound near as good as a good set of stereo phones, but agree that it's easier to demonstrate to visitors using the speakers.

Regards
W4ZCB

Tim / TE,

Look on eBay for one of the Center Channel Speakers from a
Sound-A-Sound System that has a Wooden {Particle-Board}
Speaker Enclosure. These usually have a Pair of 4" to 5.25"
Mid-Range Speakers and a much smaller Tweeter placed
between them.

Here is an Example of a Center Channel Speakers Listed on eBay :
JBL EC25BE 2-Way Dual 5-Inch Center Channel Speaker
http://cgi.ebay.com/_W0QQitemZ5858432743
The NorthridgeTM E Series EC25BE center channel loudspeaker was
custom-designed to superbly reproduce the human voice. Many movie
soundtracks consist mainly of dialogue, so that the center speaker
shoulders the burden of filling a home theater.

"The 'SOUNDS SWEET' Communications speakers maximize intelligibility
from your transceiver, receiver or portable by reproducing only the
communications voice and shortwave music frequencies coming from your
SSB, AM or FM communication or shortwave radio."
GoTo=> http://www.soundssweet.com/
A Little "Pricey" at $99.

Also, if you are using one of the 'portable' AM/FM Shortwave Radios.
Check-Out the Kiwa "Audio" Mods for a better sound from your radio.
[The Speaker is only as 'good' as the electronics that is driving it.]

FWIW - External Speakers for the ICOM IC-R75
http://groups.yahoo.com/group/icomr75/message/4360
Here are the Two Most Often Recommended External Speakers
for the Icom IC-R75; as suggested by the Members of ths eGroup.

#1. RCA Mini-Speaker Pro-X33AV
Radio Shack Cat #40-5000
http://groups.yahoo.com/group/icomr75/message/1312
A shielded 2-way speaker with a 3" woofer
and a dome tweeter about 6.5" high.

#2. RCA 20-Watt Full Range Mini-Speaker
Radio Shack Cat # 40-5024
http://groups.yahoo.com/group/icomr75/message/2031
http://groups.yahoo.com/group/icomr75/message/769
A shielded full range 4" speaker. It is a Black 5" cube.

NOTE: The general comment is that both of the above external
speakers in the "Black Color" looks very sharp next to the R-75.

OTHER - Speakers mentioned frequently that are good with the R75.
* Optimus PRO-X88AV's RadioShack Cat # 40-2084.
* Barjan PROnouncer (320-25) 4".
* Radio Shack XTS 25 (40-1999A)

* Radio Shack 21-549A isn't a 'full range' music speaker. It is
a 'communication/voice' speaker.
* Minimus 7 Speaker by RadioShack 4" Speaker
* KLH 911's (2-way semi-compact at about a foot tall)
* Mocom 70 4".
* Grove SP-200B sound enhancer

NOTE - Most 'matching' Speakers offered by OEM manufactures
are basic 3"-4" Speakers in a Sealed or Ported in Metal Enclosure
designed to opperate on a few Watts output. A simple Speaker in
a tin box for $60-$120. But Hey it 'matches the Receiver and has
the OEM's 'Brand Name' on it.

Go to Ebay and buy used Minimus speakers...

Search for minimus, radio shack, and RCA, the last brand on them..

I have a set of the RCA and two set's of RS Minimus, and the RCA and the newer of the two Minimus are exactly the same, except for the RCA logo.

RCA:

At my old job, I used to not get to Parts Express'
website for just that reason.

I give up!! Obviously my 52 years of mobile installations were all wrong!

A vertical fed against ground is by definition a perfect match for coax.
There is no need to make it a 'balanced system'. If rf exists on the
coax there is a poor ground in the system that should be addressed and
solved.

I used to live near that area. I spent 30 years in Middletown Ohio, and five of those years commuting to jobs in Cincinnati. :)

My high school had a ham radio club back in the '70s. It was Lemon-Monroe High School in Monroe Ohio.

The IT department wouldn't let us access "Accurate Screw Machine Company", and they were our source for oddball electronics hardware.

~~~~~~

More likely you have had one year of experience 52 times.
~~~~~~

Consider an eight foot center loaded whip on 80 meters. The feedpoint impedance of the whip is going to be very small - an ohm or two. Worked against an automobile chassis which, capacity coupled to the earth, will have an impedance of somewhere between 10-36 ohms, you will have major imbalance. No amount of "grounding" will improve the imbalance. In fact, just the opposite. The closer you come to the theoretical perfect 36 ohm ground, the worse the imbalance gets.

Now whether this is a problem in a particular installation is a different question, but the imbalance is there. The coax will have a large differential current flowing on the outside as a direct result of that imbalance. Some authors will tell you how important it is to ground the chassis of your transceiver to get rid of this current. Do that if you want, but I think it's better to keep that current away from your transceiver in the first place. A current-type choke at the whip's base will prevent that current from flowing and will keep it in the antenna and in the car's body where it belongs instead of on the outside of the coax. Done properly, your transceiver's chassis should have no RF on it to need grounding in the first place.

Bill, W6WRT

SOLDERSMOKE!
A SHOW FOR ELECTRONICS HOMEBREWERS!
http://www.ourmedia.org/user/36170

Topics discussed in SolderSmoke 14:
-- LTSpice: QRP-L discussion, WA5BDU tutorial, KE6US site
-- Understanding feedback amps
-- Model of Warbler amplifier
-- PIC-El board frequency counter
-- Color burst crystal filters
-- 70cm/2m diplexer & butane soldering iron
-- SolderSmoke's BLOG
-- The return of the Stardust spacecraft
-- The whale that visited Bill's neighborhood
-- HCJB and quads
-- Mailbag

Listen at: http://www.ourmedia.org/user/36170
just scroll down to SolderSmoke #14 Our Blog is a bit further down on the page.

Background:
Tired of listening to Led Zepplin or NPR on your I-Pod?   Wouldn't you like to be able to carry with you a show about homebrew electronics? Mike in Juneau, Alaska, and Bill, in London, England meet regularly on the ECHOLINK system to discuss their homebrew radio projects. We are making them available as PODCASTS.

You can subscribe to the program, have them downloaded to your MP-3 player, and listen to them at your convenience. To subscribe, just cut and paste this URL into your I-poder (or similar) software.

http://www.ourmedia.org/mediarss/user/36170

If you don't have an MP3 player you can just go to the site below and listen to the latest program (and earlier editions) using the audio software on your computer.

http://www.ourmedia.org/user/36170

We hope you enjoy the program. Please send us feedback.

Regards from London
Bill

I don't understand this at all. What does antenna feedpoint impedance
have to do with imbalance?

I know of two causes of current on the outside of a coax cable,
conduction and mutual coupling, and I think I understand the mechanisms
quite well. But neither has anything to do with the antenna feedpoint
impedance. Can you explain what the mechanism is for an impedance
mismatch to cause a current on the outside of the coax?

Roy Lewallen, W7EL

It's a counterfeit.

Probably sourced from known counterfeiters SOUND EMPORIUM, known scammers.

RIPOFF ALERT!

Bill, could you explain what you mean here? Where is the
second equal-magnitude/opposite-phase current flowing?
Through the vehicle chassis? Through the ground under
the chassis? Since the vehicle's counterpoise currents
are necessary for resonance, what good does it do to
choke the coax currents when the coax braid is connected
to the vehicle chassis at both ends?

\~~~~~~

The impedance mismatch I was talking about is between the halves of the antenna, not between the antenna and the coax. A mobile antenna with a typical center loaded whip operating on a relatively low frequency such as 80 or 40 meters is severely unbalanced in that respect. That does not mean it won't work or is inefficient or anything of the like. Only that it is unbalanced, much like a non-resonant long wire worked against ground.

~~~~~~

The coax braid may be connected to the chassis at the antenna end, but not at the transceiver end, and the result is often a "hot" chassis. Some "experts" advise to ground the chassis with a short, heavy conductor to cure the problem, but I feel it's better to keep such currents off the coax to begin with.

That does not mean such methods don't work or are inefficient. I have operated both ways and both ways work. I just prefer not trying to "ground" current which should not be there in the first place.

hi just bought a standard hx 290 of ebay and was told it was on marine
band vhf. only thing is i misunderstud the advert and thought it was
already tuned to marine band and not that it will be able to recive on
there freq, so now i am trying to get infomation on how to program it,
is there any one that can help me please on soft ware prog lead etc or
some one that can do it for me and at what cost. i think i might have
the software but i stil need a lead
thanks for any help ray

I would be interested in hearing and seeing examples of very small
workshops (closets/small apartments/small bedrooms) and how people have
adapted a workshop to a very small space. Pictures or links to pictures
would be great. I would think the challenges of lighting, ventilation,
power and space would create some interesting solutions. Any articles
that discuss this subject would also be welcome.

Thanks for any contributions you might offer.

WOW, too bad I didn't see this about 20 years ago. Three experiences - I had a back room in our basement - the house being 4 rooms - small at that. The room I got was like 5'4" high, which I had to duck to walk into as there was a step up into it - were it flat with the rest of the basement - I'd have had no trouble. It was about 6' deep from door to back wall and 5' wide. I had two very small tables in it, a chair and used the small nooks and crannies for storage. The one table being my bench. I was crowded - but I can say - all was in easy reach..... I even had a stereo there for music, bright lights for total illumination, and a few other nice additions. In another home I lived in, I had a small closet for my workbench "and" Ham shack, we were in an apartment building, no basement and the new bride didn't want to see the stuff. Crowded as much as if not more than my room as mentioned above, but hey - it worked for the time. There is something to be said about those close quarters - one thing as I mentioned, all in easy reach. I have a lot more room now, but I DO sort of miss those days! It just goes to show, you adapt when you have to. The more room you get - the more junk you tend to rack up.... As to lighting, I addressed mine as mentioned. Ventilation, it could get stuffy, if soldering a lot - if working on tube equipment, it could get warm. And, if ya ate something good for dinner, you could stink yourself out too! Power - you tend to utilize all sockets and pipe some in from outter rooms if need be. It isn't the end of the world having to deal with such an issue. As they say, ya gotta do - what ya gotta do...... I've even had my work areas when staying in a 26' camper - utilizing - again, any available space. Actually - it can be neat! Its all in how you lay it out and approach it in your mind. One thing - DO NOT block yourself in - in case of fire or shock hazard. Take any appropriate precautions against fire and so on.

Hint for increasing storage space where there is little wall space
available.
For doubling the storage capacity of an existing
wall of steel cased,plastic drawered component
storage cabinets.
Obtain some extruded aluminium channel sliding
door gear used in domestic clothes cupboards etc.
Fix the runners to the top of the cabinet/cabinets.Fix channel to

ceiling/stout shelf in
front of and above(to avoid fouling top layer of drawers) the existing wall
mounted cabinets.
Fix a couple of PTFE slabs to base/rear to run against a sheet of wood or
metal fixed under
the existing units. Cabinets can be doubled up,pop-rivetted together
vertically with bridging
plates across the joins. Even trebled up if heavy components are placed in
the wall mounted units. For every
3 existing units maximum of 2 sliding ones for access,for 4 fixed then 3
sliding etc.
Theoretically 2 layers of sliding and 1 layer fixed cabinets would be
possible.

Other than the obvious comment - more mains outlets,
anyone any ideas for avoiding the rat's nest of knotted mains leads to
numerous test gear hanging around for perhaps once or twice a month use, so
not on a shelf
for once a year use. ?

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

It's not every day I post a followup to my own message, but it seems
appropriate here.

If you would like to experiment with this, try operating 17 meter
mobile. If your installation is like mine, the length of coax will be
very close to 1/4 wave on 17 (about 13 feet) and the transceiver's
chassis will be "hot" for RF. We all know about a 1/4 wave conductor
grounded at one and what happens at the other end.

I believe - correct me if I'm wrong -  that current on the outside of
coax is not subject to the velocity factor issue because what's inside
the coax is not involved. It's just like a piece of wire in this
respect.

It would be interesting to try it with a 26 foot coax but I haven't
gotten around to it yet. Most likely it would only be effective on the
one band anyway, since 17 isn't harmonically related to any other HF
band.

Bill, W6WRT

Wouldn't you still get RF burns if you touch the floating
transceiver chassis and anything "grounded" to the vehicle
chassis at the same time?

Guilty m'lud. However I dont see what the challenges are exactly. Lighting is the same as anywhere else, except you'll only have 2 lights on at most. Ventilation, I assume it has a door and window. If not, it still has a door... one hopes!

Power is simple enough, just flex and multiple sockets, route the flex wherever it can go. Modern 4/6/8 way sockets have made this very quick to implement. Wiring them in pairs makes them usful, 4 outlets isnt much use. Shortening leads can avoid a whole lotta wiring mess. 2x IEC leads in one plug tidies things up too. Many British plugs will grip 2 flexes happily, though not all.

Space... it all follows simply from one basic concept: storage effciency. Storage efficiency is the volume of goods divided by the volume of space its stored in. If you have say a 2'x4' table, and have 1 foot depth of kit on it, and another 1' underneath, your efficiency is 2'/8', 25%. (8' is the floor to ceiling height). Always store from floor to ceiling, any unused space is not good. Using standardised box sizes makes for better packing than odd sizes.

Theres nothing difficult about working in small workshops, as long as you dont care about neatness, order, and dont mind working with goods stored overhead, wires running up table legs, narrow access passages and so on. Forget about swivel chairs.

Dont forget to make the storage boxes as frogs legs, heads, arteries, etc. It keeps visitors at bay.

one last point: you wont see pics of small workshops. Its not possible
to capture the whole shop, or even much of it, from one camera
position. And to see anything you'd need a very wide angle lens, which
most people dont have.

Can't get a picture because it was in my previous house...

Six foot wide closet with folding doors.

Bought a pre-made Formica kitchen counter at Home Depot, notched it to
fit and dropped it in as my bench.

Multiple outlet strip across the back. Parts cabinets above.
Fluorescent fixture above, plus a small goose-neck for close-up
illumination.

Close the doors and you weren't aware it was there... wife loved it
;-)

Now-a-days I solder maybe twice a year... haul out scope, signal
generator and DVM, and just do it on my office desk.

...Jim Thompson

Best thing I ever did was to use kitchen tops for the workbench.As
they have a sloping edge,I placed two together with the slope abutting
in the middle to form a V shape.
this has caught more dropped screws etc also a good place to lay
screwdrivers etc to stop them rolling off the bench.A good safety
idea,well at least for me.regards

For Trade: I have a Like New Yaesu FT-817ND with new W4RT High Capacity
Internal Battery.
It comes with the Original Manual and Standard Accessories that came with it
new, Shipping Box,
Mic, Power Cable, etc. Also have an as new Miracle Whip antenna and a nice
black Carrying Case.
This gear only has a few hours on it. I just do't do much QRP. I would like
to trade for a similar condition
Yaesu FT-857D or sell package for $575. Thanks, Charlie Hugg, K5MBX

Guess I don't understand what you mean by an impedance mismatch between halves of an antenna. Can you elaborate a bit, and how it causes current to get to the outside of the coax?

There's no reason a non-resonant long wire worked against ground should produce more current on the outside of a coax feedline than a resonant one. The conducted current on the outside of the coax is determined by the relative impedances to ground of the two available paths at the shield connection at the end of the coax. In the case of a grounded antenna, the ground system is one of the paths. The other is the outside of the coax. If the ground system is any good, its impedance is much lower than the outside of the coax, so very little current flows on the coax. Changing the "antenna" makes very little difference to the relationship between those paths, so it has very little effect on the current conducted to the outside of the feedline. You can find a more detailed explanation at http://eznec.com/Amateur/Articles/Baluns.pdf.

Unless you're using the shield strictly for electric field shielding at very low (like audio) frequencies, you should *always* connect the shield at both ends, with low inductance connections. Think of a rig with an SO-239 connector. There's current coming out of the center pin, and there's an equal amount flowing in the opposite direction on the inside of the shell part of the connector. And inside a coax, there are equal and opposite currents on the outside of the center conductor and the inside of the shield. If you connect a coax to the rig via a properly installed PL-259, all the current on the inside of the SO-239 shell ends up inside the coax shield, and all the current from the SO-239 center pin ends up on the coax center conductor. Both sets of conditions are satisfied, and there's no current left over to flow on the outside of the coax or the outside of the rig. But what happens if you cut the shield at the rig? Then the current on the inside of the SO-239 shell has nowhere to go but over the edge and over the outside of the rig. And the current on the inside of the coax shield flows over the edge of the coax and along its outside. Somehow there'll be a path between the two, by conduction or coupling -- otherwise the rig would see an infinite impedance and no current would flow at all. But you probably won't like the path the current takes. It'll cause radiation from whatever it flows on, and because of the path impedance, RF voltage drops will be created between the coax shield and the rig, and anything else in the path. You might be able to alter its path with "ground" wires and such, but you'll have a lot of trouble controlling it, and it'll always be flowing somewhere besides where it should be -- on the inside of the coax.

My aunt, who lives in So. Calif., along with two close neighbors, is suddenly having problems with garage door openers. Won't open. Stop part way down, etc. I haven't heard of amateur radio having an effect on modern garage door remote receivers. How about BPL? Don't know if it can effect things in the 900 Mhz region, but thought I would ask if anyone else has seen this.

I'd be surprised at BPL causing this, given its low signal strength, but I suppose something to consider.   I recall hearing of some new military "secure" communications system having such effect on garage doors.... but occurs over many square miles, not just one small local. The problem I read about was back in the South East, I think.

I guess if just a couple houses next to each other are having issues, one would begin to look in that vicinity.

BPL would not, I think, as all of the BPL systems I've heard of use HF and lowband VHF on the power lines (and some use 2.4 gig or other ISM-band frequencies for uplink to the ISP).

I have heard of people having serious problems with Part 15 devices which operate in the 433 MHz region (as many garage door openers do). The primary user of this slice of spectrum is the U.S. government... it's allocated for radiolocation (radar) and there may be other government communications in that band as well, I suspect. Some months ago there were reports of people living around certain government air bases and other installations began having garage-door-opener blackouts, because some new radar systems had gone into use and were interfering with the Part 15 receivers.

There might be similar problems in the 900 MHz ISM band, I suppose.

A local amateur radio operator transmitting in either the 70 cm or 33 cm amateur band might cause transient overload of a Part 15 receiver using these frequencies. I'd expect this to be a relatively short-lived phenomenon, unless somebody's operating a popular repeater in your neighborhood.

Thanks to all who replied -- I certainly appreciate everyone taking time to help me. Of course, as usually happens with newsgroups, the thread wandered somewhat from the original question -- which was how to route my coax and mount my rig so as to avoid firing the seat belt retractor.

I have solved the problem -- the dealer had a tech bulletin that told me to keep coax 12 inches from the retractor and to ground everything -- so -- I drilled a 1-inch diameter hole in the floor board under the driver's seat and installed a plastic plug in the hole. I drilled two 1/4-inch diameter holes in the plug through which I routed the coax -- one cable for HF, one for VHF/UHF. Grounded the negative power lead to the chassis in the engine compartment; grounded the rig (which is under the driver's seat) to the frame by loosening a seat mounting bolt and grounding one end of a pigtail to that bolt and the other end of the pigtail goes to the rig's chassis.

The stake hole mounts have mounting bolts in their bottoms. Remove the tail light assembly; drill a 5/8-inch hole in the bottom of the bracket in the stake hole; grind off the paint from around the hole with a Dremel tool; put star lock washers on the bolt that comes out the bottom of the stake hole mount and tighten the living shit out of the mounting bolt, thereby grounding the antenna mount to the chassis sheet metal. There are already factory-installed ground jumpers connecting the sheet metal to the frame.

Fired it up at full power and nothing bad happened; SWR looks good; ATAS-tunes normally; made a few contacts on HF, VHF, and UHF.

I'll post photos, etc., to my web site in a few days when I get it all cleaned up.

You'd be somewhat better off running the power-ground wire all the way
back to the battery, and connecting directly to the battery's negative
post. Include a fuse in this line just before it connects to the
battery negative.

Avoid using the body frame for high-current power supply ground
return. It's too easy for noise from other portions of the
electronics to get into your power, due to the non-zero resistance of
the shared ground path.

Clamping a couple of RF-suppression ferrites onto each coax at various
points along their runs might also help block, or dissipate, any RF
which does try to come back along the coax.

Adding a corrosion-preventive antioxidant paste or cream between the chassis, washer, and bolt is a good idea, also. It'll help make sure that infiltration of oxygen and moisture does not cause this critical grounding junction to go high-Z in the future.

There are numerous such pastes/products on the market. The one I used is a copper-loaded grease marketed by Butternut, under the cutesie name "Butter-it's-not". You might be able to find an equally usable copper-grease at a good auto-supply store.

There have been problems with military use of the 300 MHz band for new radio systems, but this would not cause the door to work only half way.

Assuming the neighbors problems are coincidental, check the counterbalance spring for the door. They wear out or break and the opener does not have enough power to work on irs own. By the way this is not a DIY project because of safety concerns with the springs and the repairs can be about $300.

There have been problems with military use of the 300 MHz band for new radio systems, but this would not cause the door to work only half way.

Assuming the neighbors problems are coincidental, check the counterbalance spring for the door. They wear out or break and the opener does not have enough power to work on irs own. By the way this is not a DIY project because of safety concerns with the springs and the repairs can be about $300.

Good point!

I recently had a spring break in our 1960-vintage rolling door setup... the door wouldn't even start to roll up with only one spring out of two providing proper tension.

The repairman who came out and replaced it, said that he gets a significant percentage of his business from people who first tried to do the repair themselves... and decided to call him after they got out of the hospital. The most common injury seems to be a broken collar-bone. Those springs are under a *lot* of tension.

Thanks.  I'll do all of that.  I can pick up ferrites at Radio Shack and
should be able to find the anti-oxidant paste at local auto parts place.  In
fact, local auto parts has big ferrites -- they sell them as noise
suppressors for audio installations.

This garage door and opener system are not more than a year old. I don't know the brand name, but it was not inexpensive. The door does operate perfectly with the wall button. The service people have been out and changed out both the receiver and the remotes. Still will not operate. That's why the serviceman thinks it has to be some kind of RF interference. Apparently he didn't have the equipment to trace it out.

For the record, this home is in an older residential area near the University of California Fullerton. No military installations that I am aware of. Something at the University or local high school might be doing it, but the high school is a couple of blocks away, and the University is about 1/2 mile. If I were near there, I could bring one of my receivers and trace it down pretty quickly, but I'm 500 miles away.

A long time ago someone told me about the problems that can be caused by a garage door spring breaking under tension. There is a simple safety measure. Get some of the 3/16-inch stranded cable that is commonly sold at Lowe's, Home Depot, etc. Get four cable clamps. Run a length of cable through the center of each coil spring, the length of the spring. At each end, loop the cable through something -- there are usually holes in the door mounting frame -- and secure with the cable clamps. This way, if the coil spring snaps, it will not go anywhere because the cable will catch it. Otherwise, you'll have a big piece of coil spring shooting through the garage at almost the velocity of a bullet. Trust me, I know.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

I could have worded that better. I meant that the coax is connected to
the transceiver chassis but the transceiver's chassis is not connected
to the car's chassis directly. I see why some folks took it to mean the
coax braid at the transceiver isn't connected to anything.

Sorry for the confusion.

Bill, W6WRT

(snip)

Why would that be the best arrangement? No steady state power comes from the battery. If you want the least voltage drop, you take a pair of wires back to the alternator, where the power originates. The only advantage of the battery connection might be lower alternator rectifier noise in the power, but that is pretty easy to filter out right at the alternator, before it gets out in the wiring harness and into the antenna.

HUH????   I've designed enough communication site power installations to know that the battery powers the equipment and the function of the alternator in a vehicle or the rectifier (power supply, in ham language) in a fixed intsallation is to recharge the battery "on the fly", so to speak. The current capacity of the battery is much greater than that os the charging device.

Any design that puts the load on the charging device rather than on the battery would be rejected out of hand. At best. both of them would be connectable (through switches or circuit breakers) to the load bus, with separate metering for the battery, the charger, and the load.

In your scheme the equipment would get no power when the alternator is not operating, or more clearly, if the equipment DOES get power, the power must be coming from the battery.

Think about it.

I've never heard of anyone hooking up auxiliary loads right at the alternator. I can imagine somebody hooking a secondary-battery feed at this point (in an RV, perhaps) but I don't think I've ever seen radios hooked up there.

I rather strongly suspect that you'd find the amount of "alternator whine" in the audio to be significant greater if you hook up the radio right at the alternator.

Every mobile-ham-radio installation guide I've ever read (including the owners' manuals) seems to recommend running heavy wires back to the battery.

I have yet to see "any" manual which suggests going to the "Alternator" for voltage to run a radio, be it Ham, CB, or Two Way or even just electronics books which may touch the subject of wiring radios or anything else for that matter - into vehicles. I don't know where this guy read his information, I'd love to know where the idea came from. My gosh, the whine is bad enough sometimes at the battery, let alone the Alternator - the mother of it. Most suggestions are to fuse both the positive and negative leads on the radio (going to the battery) - although you can get away often - with grounding the negative and fusing the positive to the battery (for best results) OR to some point to feed the 12 volts if the current supply is ample - ie the cigarette lighter or some other place people tend to use. "I" don't suggest that, but people do use them....... Of course - the latter would be for smaller hand held CBs or the like. Anything larger, you're pretty much left with only the Battery.

I don't recommend fusing only the hot side. Fuse both. It's safer.

Fusing the ground wire protects you against wiring faults. Consider what would happen if you don't do this, and your radio's chassis is grounded to the vehicle frame, and if the main grounding strap from the alternator to the battery comes loose at the battery end. Your rig's chassis, and its ground wire could end up being a major part of the ground-return current from the alternator to the battery. The ground wire may not be able to handle that much current, and might overheat or catch fire. If it's properly fused, the fuse will blow.

I'm with you - I was just alluding to - in some cases, like CBs, people get
away with fusing only one lead. My personal opinion - fusing both sides is
the only way to go and most manuals I've read "do" suggest "both leads
fused".

I am using a Yaesu FT-857D. The power cord that comes with the radio is
approx 8 feet long. At one end is the plug that matches the power jack on
the radio. At the other end are TWO inline fuse connectors -- one in the
red lead, one in the black lead -- with approx 10 inches of wire coming out
of each fuse holder, bare at the end, to connect to the battery (or some
other source of power). The inline fuse holders take standard automotive
blade fuses. So -- it looks as though Yaesu intends for both positive and
negative leads to be fused.

I have always subscribed to the fuse both leads theory too, but here
is what the Chrysler engineer's say about the installation of radio
transmitting equipment in all their vehicles:

"DO NOT FUSE THE GROUND LEAD.  If the ground-side fuse were to open,
the entire supply current would be conducted by the coax shield.  This
could cause the feedline to overheat with possible resulting damage."

I would rather smoke a few dollars worth of coax  than a 20k+ automobile.

I think that's the whole point.  It's not the coax they are worried
about, but causing a fire in the vehicle from overheated coax is.
Usually, when manufacturers come up with these "rules" it's to
minimize litigation by the vehicle owners.

Well lets hope the new model will be more reliable than the Mark V. I did not buy one because of all the complaints of both the 100 watt version and expecially the 200 watt version blowing up and requiring multiple trips to Yaesu repair.

I looked at the Kenwood TS-2000, but it is just too ugly. Multiple eham.net reports also suggest that it is deaf. As far as the Icom's, I look at an LCD screen on my computer all day at work. I really don't want to look at another computer screen when I come home from work and turn on my ham radio.

~~~~~~
~~~~~~

I think John is right, however I would never do it that way. The extra millivolts you pick up are going to be smothered in alternator noise and if large enough, might actually be too high for the radio. Radios are typically designed to run from 13.8 volts maximum, whereas alternators often put out more than that.

The additional few watts you get from your transmitter will not be noticeable in normal operation anyway.

~~~~~~

If you connect the radio's negative lead (unfused) to the car's chassis you should be ok. A problem can occur if you connect the radio's unfused negative lead directly to the battery terminal, as is often advised.

If the car's ground wire from the battery to the car's chassis ever comes loose and you go to start the car, all the starter current will try to flow through your radio's negative lead and through your coax to
~~~~~~

where the coax is grounded at the antenna feed point. I have seen pictures of what this several hundred amps does to a radio and it's not pretty.

Most radios today are supplied with a power cord having a fuse in each lead for good reason. Don't defeat their purpose.

73, Bill W6WRT

Does anyone else think the Kenwood TS-2000 is ugly? It seems odd that a company like Kenwood could come out with a radio as beautiful as the Kenwood TS-940, and then follow it up a few years later with a radio as ugly as the Kenwood TS-2000.

Anyone know where I can get a schematic for the MFJ-1270C (not B) TNC? The manuals I have downloaded from both MFJ and mods.dk don't seem to include schematics.

I'm finally getting the time to getting around to selling all the

```
paging stuff I've used in my repair business.  I would say probably 10
years worth of stuff all in rubber maids :-)

I'll be putting a bunch up on ebay But I figured I'd drop by here first
to see if anyone is looking for anything special ??

What do you need ???  I've got it all

I also have a Very Nice Marconi 2967 with just about all the options
unlocked on it up for sale too.  Taking offers on that .

Hello Charlie

Interesting TS480SAT...
It not sold else?

What would be shipping to Moscow, Russia
withUSPS global express EMS?

Payment - Western Union.

73!

Seeking for a service manual for my FT-290 R/II on the net to download.
Where can I find one, www.mods.dk doesn't have one.

Regards,

Ralf

Does the Yaesu FT-897 essentially have the same receiver & transmitter as
the FT-857? If yes, then why does the 897 weigh about 40% more? Besides
battery operation what does the 897 have over the 857? Thanks in advance for
any comments.

Cordially,
west

> Does the Yaesu FT-897 essentially have the same receiver & transmitter

> as the FT-857? If yes, then why does the 897 weigh about 40% more?
> Besides battery operation what does the 897 have over the 857? Thanks
> in advance for any comments.

Never used either, but have seen both up close. Off hand, I can see that the larger housing, with internal brackets to hold batteries, plus the larger display, would be contributing a lot to the weight difference.

Hi All,

We are in the process of reviving the band in our area and would be very interested in finding a set of 220 Duplexers..

Any of you have an old defunct 220 repeater laying around you want to part out?

Jim..

kb6zop at manicarcade (dot) com

Thanks!

A friend of mine inherited some HAM gear when his father passed away. He, himself, is not a HAM. He needs to find a home for his father's equipment. He is willing to give it to anyone who will pay the shipping or pick it up at his place. He has no idea what any of it is, but would rather give it to someone who can use it than send it to the car crusher in an old car (his only other option).
I offered to post pictures of the stuff, but I need to know where to post it so HAMs could find it. Does this NG have a binaries group that you guys use as a binaries portal? Would someone be willing to post the pictures on their website?

Rick

Some clue as to where your friend is located, at least to state may find someone local who would grab it up. You also may wish to get the nomenclature which might be a good hint for the rest of us as to what is valuable and what is recycler material. You might also check Ebay. There are often ads with just the dilemma you pose...inherited equipment. There are many afficionados who do bid on this. Look for brand names such as Heath (or Heathkit) Hammarlund, Collins, Hallicrafter, Nationa Receiver, Drake, Johnson Viking for which there are many ham hobbyist who restore this stuff. Check out Ebay, plug some of those names or ham transmitter into it. Also try the words ham receiver, ham transceiver and see if any of this is recognizable. Some of this stuff is very heavy so some folks might think twice about having it shipped unless they could have the option of a local pickup or maybe a couple hundred miles drive with an SUV or truck. There are a few guys who buy whole estates, fix up and resell this stuff to folks interested in antique radios (which means almost anything before the transistorr era. Equipment for the 50'/60's are particularly interesting to many. More modern equipment, being simply used vice antique will sell or not sell based upon its intrinsic merits. If you give us a city, we might be able to provide you with a point of contact for a nearby radio club whose members could help you.

Hi Rick,

best would be to find a reliable ham who can help you with valuing the stuff.
Find one
through one of the local radioclubs (addresses via www.arrl.org for example). If he want
to do it the easy way, donate the equipment to some type of charity which can

handle the
sale. http://www.wb2jkj.org/ is one which I see advertising all the time, check
them out.
If all else fails - call your local NPR radio station, most will accept donations.
Some
of this old stuff can be very valuable when sold on Ebay but it takes some
knowledge.

Where are you located?
Glad to help out if you are in the Portland, Oregon area.

I have frozen the FNB28 battery case to open it up, and it has worked
perfectly, but when replacing the rechargable cells, do you keep the
components such as the thermal overload etc in the case, or has freezing
  destroyed them?

Wire all EXACTLY the same way, just replace the cells out....
I have done this with my Standard packs, and doubled the capacity by
switching to better cells with the same dimensions....

I asked a similar question about ICOM packs (I didn't know about freezing)
and found that the problems that I had were related to corrosion,
which destroyed the microphone (ICOM had microphones in their packs
for a while, for full duplex operation) and a really cheap heat sensor
in an OEM (Periphex, circa 1995) pack whose leads broke off.

I replaced them with NiCad cells because I did not have a charger that
could charge NiMH cells properly and I had a bunch of them in the junkbox.

73,

Geoff.

Have you considered giving the gear to a Ham Radio School club ??
In San Diego, we have supplied three schools with like items.

If it is too old, then the school kids can take it to an auction or e-bay it
and apply the funds to more modern gear.

Or there are some shut in poor seniors that would be worty of a donation

--
CL -- I doubt, therefore I might be !

<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5857659690>

Available on eBay is a complete set of four Motorola MX350S
Synthesized, DES Encrypted VHF radios. The system comes with a six
position charger/conditioner, batteries, manuals, RF test cable AND a
DES Keyloader. Because this system uses DES Encryption, it can only be
shipped to a U.S. address.

Thanks,

S

It would be a great help if we knew where the equipment was located (i.e. what corner of what state?)

If it is anywhere near Sacramento CA, the ham club at Sierra College would be very grateful for the donation of equipment.

rec.radio.amateur.misc:3698 rec.radio.amateur.equipment:2120

This question does not fit perfectly into any rec.radio.amateur newsgroup so I'll cross-post it to three groups and hope someone can help me.

The question involves the dangers of RF energy from HF, VHF, and UHF rigs around automobile electronics.

I am installing a Yaesu FT-857D in a 1997 Mazda B4000 truck -- 4.0L V6, 4WD, 5-speed, with extended cab.

The control head for the 857 is separated and mounted on the plastic bezel around the gear shift lever. The rig is mounted on the floor under the driver's seat.

Underneath the truck, on the rocker panel just beneath the seatbelt anchor point, is a factory-made hole in the floor. This hole is closed with a removable rubber plug. I ran the radio's power lead through this rubber plug, along the frame, into the engine compartment where I attached the positive lead to the battery and the negative lead to chassis ground.

I planned to run the antenna leads out through the same hole then run them along the frame into the sidewall of the bed to the rear of the truck where I will mount a VHF/UHF antenna in one rear stake hole and an ATAS-120 in the other rear stake hole, using the GeoTools mount:
http://www.geotool.com/antmount.htm

I took the truck in for service last week and the service advisor gave me a long lecture about keeping the coax away from the air bag and away from the seatbelt retractor. He told me the retractor has a small explosive charge in it that can be set off by radiation from coax. Ditto for the airbag.

The route I planned for the coax takes it right next to the seatbelt retractor and I am now re-thinking my installation. I could route the coax from underneath the driver's seat directly to the back of the cab and drill a hole in the floorboard, centered on the cab at the back wall of the cab, and run the coax out of that hole. This would get a foot or more separation between the coax and the retractor.

I plan to ground the hell out of this installation.
-- The power lead is grounded to the frame in the engine compartment.
-- I have a 10 gauge pigtail -- one end will be bolted under one of the bolts that attaches the seat frame to the floorboard and the other end will be bolted to the 857 chassis.
-- The antenna mounts bolt directly onto the chassis; I will sand off the paint and use star washers to get good contacts at these mounting points.

Also, I will use double-shielded RG-8X for the coax.

I see a lot of trucks like mine (the B4000 is the same truck as the Ford Ranger) with CB installations -- I have never stopped anyone and asked but it seems to me the normal CB installation is nowhere near as good as mine and they don't seem to have problems. Of course, I'm running 100 watts and they are running only 5 (right???).

Has anyone out there had experience with HF mobile installations in the Mazda or Ranger pickups?

Thanks for your assistance.

Hello,
I'm looking for a source for Stabilock 4031 modules.

The parts I'm searching for are:
Monitor Control module 236 062
Tracking IF module 229 034

Any feedback would be appreciated.

That looks like about $6-700 at the local CompUSA. With rebates, maybe
lower. Your price?

~~~~~~

You ought to think the hell out of your grounding plans first.

Remember, "grounding" simply provides a current path that did not exist
before. This can be good or it can be bad. Know what current is flowing
and where and why. "Grounding" stuff willy-nilly is not good
engineering. Make the current go where *you* want it to go or not go.

They are the latest things, called "pre-tensioners" they fire along with the airbags. I would think that routing the coax as far away as possible and making sure the radio and the antenna base (and antenna end of coax shield) are securely grounded would be sufficient.

He should carefully check all options to see if their is a way to avoid most of the wiring loom in the vehicle.

The use of the stake mounts, concerns me because they might not ensure
mettalic grounding of the antenna. I would make sure the antenna is
grounded to the truck bed and the truck bed to the vehicle frame by
short <1/8 wavelength wires.

I have for sale a brand new never used Riley's Accessories Amplifier Keying
Buffer for the Kenwood TS480SAT/HX. I has the mini din plug
for the radio and the RCA jack for the amp. It comes with the Instructions.
Price is $20 plus $4.00 shipping. Thanks, Charlie Hugg, K5MBX

I would check with the Mazda dealer for a technical service bulletin
on radio installations. I know Chrysler does a great job in this
area. Because of all the computers, etc. in cars and trucks today I

would think most of the manufacturers would provide the same thing.

Dick

I will be listing ~35-45 air variables in the next month in addition to =
ones already listed on Ebay. So, pse check back frequently. Trying to =
clean out stuff. Some new ones are listed now and the mostly used ones =
(receive & transmit) will be added a few each day or every other day.  =
Tnx for stopping by:

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZheytubeguy

I have the Alinco. Great radio, extended receive (some mil air),
accepts modem board for packet and APRS (GPS input on front face of
radio, RS-232 (DB-9) on rear, also accepts digital board for GMSK
digital audio communications with other GMSK compatible radios (ICOM

Alinco, etc.). Also, alpha tags are nice. I have the 135 for APRS (N6XQY-12) and the 235 for the California CONDOR system (linked 220MHz system covering most of CA, some of AZ, NV). Now looking at the dual bander if I ever need to replace my Kenwood TM-V7A.

Enjoy es 73,

Doug Gavilanes, N6XQY
Garden Grove, CA.

> Been out of Amateur for more than 20 years and would like to know when the Kenwood TM-331A came out and how does it compare to the Alinco DR-235T, both 220 transceivers? I know the Alinco can be modified but there is no info on the mod site re the Kenwood, not that it's important. Which one would you buy and why? All comments & opinions very welcomed. Thank you.

Greetings from So.Cal.

I'm at wits end, now having gone through 4 antenna mounts on my vehicle. This is the situation: I have a Jeep Wrangler, on the rear of which I have a trail rack (for cargo, and mounting Gerry cans). Over the last few years, the trail rack has become my mobile antenna farm, hosting a Diamond NR770 NMO dual band whip, a 1/2 wave Larsen base loaded NMO 220MHz whip, a 1/2 wave Larsen base loaded NMO 144MHz whip (for APRS), and a Larsen VHF-UHF-800/900MHz NMO center loaded monitor antenna. For HF, I mounted a K400 mount with 3/8" stud for a Lil' Tarheel II compact screwdriver (16" body, plus 5' whip), on the left rear corner of the trail rack (about 6' off of the ground). This location puts the antenna at a high point at the rearmost location on my Jeep. Being a short wheelbase vehicle with a 3" lift and 32" tires, the ride is inherently bouncy. The daily commute on the I-405 in the South Bay of the L.A. basin injects speeds of 5 to 70MPH during the commute. To date, I have cracked the base plate of the trunk lip K400 mount around the front edge of the round protrusion where the adjustable head of the mount supports the antenna. Twice, on separate new K400 mounts. The K400 is too flimsy (the fact that it is being made in China from metal not of the same original stainless grade as the original article is a separate issue) to support the stiff antenna, which is bounced and rocks front to back and side to side on every bump, dip, and pothole. Complicating matters is that the mount is at the rearmost and highest point on the rear of the vehicle, and the momentum of flexation is greatest at this spot. However, it is the absolute best spot to mount the antenna for performance and loading (perfectly flat on all bands 10 through 75M).

My Alinco DX-70T only delivers 100W, and when mobile in motion, doesn't always have enough punch, so I enlisted an amp that would provide me with about 200W PEP, the max. rating of the Tarheel II. The amp exceeded this a few times, and after replacing the coil once, Tarheel informed me that a new compact version was under development, with a max. rating of 500W PEP. Armed with this knowledge, I installed an Ameritron ALS-500M with remote and soon abandoned the K400 and smaller Tarheel II for the heavier duty Tarheel "Stubby" (16" body with 5' whip) and a new Hustler stainless ball mount. Worked great, but within two weeks, upon arriving at my office one day, a co-worker asked me if my antenna had broken. When I went out to check, the antenna had rotated down at a 45� angle into a big 6.5' curb feeler mode into the left parking space next to me. I removed the antenna, and found that the outer ball half had cracked at the 3/8" stud that protrudes from it, causing the ball to loosen and slip. The candy store was nice enough to replace the part under warranty, and that night I was back on the air.

A couple of weeks later, I noticed (during my daily mount checks provoked by the paranoia of losing a $350+ antenna on the freeway, and causing an accident, to boot) that some "wiggle" had developed between the 3/8" stud exiting the outer ball half, and the outer ball half itself. Enough movement to make me fear that another 30 or 40 miles would be enough to snap off the antenna cleanly from the replacement ball mount, unexpectedly. I removed the antenna, and searched for a stronger mount. I remember the old Motorola stainless ball mounts from the Broderick Crawford 2150 days, and that they were nearly bullet-proof. I also remembered that Antenna Specialists made them for Motorola (ASP-3, or something like that). These are as rare as $3 bills nowadays, since A/S abandoned making them. However, I collected an ancient Batwing ball mount with a cracked gray phenolic base (too bad, as that's where the Moto branding was) years ago at the swapmeet, so I tore my garage apart and finally located the old gem. I retired the Hustler stainless hardware, and installed the Moto / A/S stainless hardware into the black phenolic Hustler baseplate. Perfect fit, and very tight mount (no slop at all). About three and a half weeks have passed, and I have just discovered the same "wiggle" that caused me to scrap the Hustler ball mount. Needless to say, my screwdriver is again off the air.

Sorry for the preceding "diary" - but a good understanding of my dilemma couldn't hurt. Now, does anyone out there know of a strong 3/8" stud mount that will support my screwdriver (which probably weighs about 8 to 10 pounds, with a 16" body, 2" dia. coil, and 5' whip) now and forever?

I am able to bolt into the 1" square tubes of the trail rack - that's how I affixed the fabricated steel mounting plate that I put on the side of the rack to host the ball mount. The top and bottom tubes are about 4" apart. Can anyone offer a practical solution? My HF capability is important to me (ARES emergency comms and stuff, you know...). Thanks in advance.

73 de Doug, N6XQY

Texas Weather Instruments developed the 1-WireT Weather Station, using technology licensed from Dallas Semiconductor (see Sensors magazine June 1998), to solve the problems of attaching multiple cables, power supplies and consoles associated with weather instruments to a Windows PC.
http://www.txwx.com/1wire_bro1.htm

AAG Electronica (Mexico) makes the kit of parts ($75), the TWI is only an assembled unit.

Help with Ameritron AL-82 Amp
I recently got an AL-82
And it needed tubes which I put in today and
It seems to put out full power on all bands except
160??
No power out on 160?? The relay goes on and no tx power comes out?
Any help on what to look for would hel greatly.
Thanks....Rich

I have several old Flying Horse Radio Amateur Callbooks for sale. They are all in very good condition for their age. Covers and binding are all intact and in nice condition. There are some creases around the edges of some of them and the pages have yellowed with time. They are all complete.
1. Winter, 1948-49 Issue, Volume 26, Number 4. Price $35;
2. Fall, 1949 Issue, Volume 27, Number 3. Price is $35;
3. Summer, 1950, Volume 28, Number 2. Price is $30;
4. Spring, 1952, Volume30, Number 1. Price is $30;
5. Fall, 1955, Volume 33, Number 3. Price is $30;
6. Fall, 1961, Volume 39, Number 3. Price is 25.
Shipping is an extra $3.00 for Media Rate US Post Office.
Thanks, Charlie Hugg, K5MBX

APRSPoint 2.2 is released. New features include,

1. Added TNC data view and TNC data log,
2. Enabled auto connect for AGW packet engine,
3. Fixed a bug handling weather station data,
4. Ability to load a default map view at startup,
5. Restore TNC settings when program exits.

and many more. The holiday sale is also extended for 2 more days.
Visist http://www.aprspoint.com for details. Thanks.

Wow, 29 years bootlegging on ham and no FCC check?  I think that's a
new record!!  There's been a couple of guys on a Militia/Patriot
net every night on 3.8-0 mHz LSB for over 3 years now with phony callsigns
who still ain't got caught or even raised a red flag with either FCC or
OHS.
but if you went along for that long and got off with a slap on da
wrist, then woo-woo on you.  (bet you were a good customer at the ham store
also eh?  Did the buffoons sel you a big amplifier too with no license
check? prolly did..)

I have one extra Cyfre CA-819 Dual Band cell phone amplifier, some specs below. Just connect to your cel phone (with optional cel phone antenna jack (depends on cell phone model) and boost output and receive - asking $250 shipped (within lower 48)

E-mail me for more info or photos.

CYFRET CA-819 Direct Connect Amplifier
Dual Band Wired Amplifier for all North American 800 MHz & 1900 MHz carrier systems (excluding iDEN Networks)
Features / Benefits
. Increase revenue through customer retention
. Less cell site build out
. Keeps customers connected to utilize the full potential of their phones and network services.
. Carrier friendly in urban areas
. Increases data traffic & data speeds
. Communication only occurs through the RSSI of the handsets
. Requires zero additional bandwidth from cell towers
. Case designed for Zero RF Emissions

CyfreT Amplifiers seamlessly bridges RF amplification between Cell Towers and todays elaborate handsets without disrupting the carrier's tower management Networks. Thus, the entire CyfreT line of amplifiers becomes an integral part of all wireless network solutions.
Network Compatibility
Cyfre'sT creation of the Digital Microprocessor, combined with licensed Motorola patented technology, have achieved compatibility with the following standards.
CDMA 2000, TIA/E-98-A&D, 1xRTT, TIA/EIA-690 Analog (dual-mode), IS-95-A&D, and GSM.

Ok, everyone who reads this post will say, I'm crazy. I have to ask for that
,Impossible Dream. I am looking for any one of  these Heath Kit,  DX 35 , DX
40 or DX 60.  In the box, never built, tucked away and forgotten for years.
I am hoping  that someone can make  my dream come true. Please email if you
can.

I am always amazed at how much someone will pay for an unbuilt Heathkit
when a built one goes for a pittance. If you put it together, it is
worthless! It is a case of wanting your cake and eating it too.

Not me.  I would dearly love to find an unbuilt Johnson Ranger II.  I
would build it just to be able to use it.  I wouldn't care what it did
to the value.  However, if there was one somewhere, I know the cost
would be completely out of sight.  So it's just a dream.

I had a chance back in the 80's to buy a Ranger II that was factory
built, and absolutely mint.  Guy wanted $100 at a swap meet.  I didn't
buy it and have been kicking myself ever since.

Dick

Hi Dick,
You could take my approach. I have a Johnson Navigator in fair condition. I am 100% disassembling it- rebuilding the wire harness out of teflon, replacing all the screw with stainless, glass bead etching the chassis, silk screening the frot panel (the right way- Johnson has the worst paint jobs of any boatanchors)- and then having the fun of assembling a one of a kind rig.

ordinary copper wire pair?

check that the devices at each end are operating correctly
and have the correct power supply etc..

maybe you need a better microphone?
possiblly one with background noise rejection.

amplify the signal before putting it into the wire
then the noise will be less significant

bandpass filter 300-3000Hz

encode the audio digitally (probably major overkill)

> professional marine application. sturdiness is more important than
> bleeding-edge performance.

keep the wires dry and waterproof all junctions...
i'd look at liquid electrical tape unless you have a superior product.

keep them away from power runs or rune them in a separate conduit from
the power

Bye.

```

FS: Motorola R2038D HS Comms System Analyzer
Motorola R-2038D HS Communications System Analyzer,  in very
good condition complete with its front cover and the RTL-4055
Wattmeter Adaptor.   This unit has a crisp, bright display and is
cosmetically in good shape except for a couple of scratches and
very   minor dents. It was in a lab most of its life and then I got it
and used it for my repeater systems. Don't need it any more.
And its in VERY nice shape was'nt used in the field, so it did'nt get
banged around. I'm a non smoker.
*Spectrum Analyzer*Duplex Generator*Modulation Scope*General Purpose
Scope*Frequency Counter*AC-DC Voltmeter*RF Wattmeter*Multimode Code
Synthesizer*Sweep Generator*Signal Stength Meter
This Unit will take care of most all of your encoding and decoding
needs. It is also fitted with the HS. High Stability Option.
Its a nice clean and great working unit!!!!!
Make offer.  Please don't ask what I want for it, just make offer and
I'm ready to sell right away.  Can pick up in Essex County New Jersey
or I can ship it.

Actually we (retired and Ex ATT,Bell,SBC and now ATT again) used to do a frequency run test with an audio signal generator and a receive measuring device at the far end. If needed we would put in a equalizing unit (Wescom, Teltrend, etc) that we could adjust the 300-to 3khz slope (sometimes up to 8khz for audio program loops for radio broadcast) with to make all frequencies as flat as possible or boost the level of the freqs as needed. You can get even more technical in the time delay at different frequencies on the same copper path traveling from one end to the other. Lets see what this stirs up.

Digitizing it, then running it on a network would give you the best
voice quality, and the network can be used for other data
( environmental, remote control, alarms, ect) plus it would be relatively
simple to set up..

Sorry I tried alt.audio.equipment with no luck.

I have a Kloss model 88 radio connected to a nearby PC that has one of those Win/TV cards.   I wired the audio out of the TV card to the CD inputs of the radio.   The CD inputs are RCA jacks.

The setup works OK, but every once in a while the radio starts "booming".   By this I mean it sounds like the bass was turned way up. If I touch or jiggle the back connection the booming goes away. The same thing happens if I use the stereo plug AUX input.

What's happening here and how do I stop it?

(PS. The radio does not have separate a grounding connection.)

Bad idea.
http://thomas.loc.gov/cgi-bin/query/D?c109:6:./temp/~c109Iy1qN7::

SEC. 114. CRIMINAL PROVISION RELATING TO STALKING.

(a) Interstate Stalking- Section 2261A of title 18, United States Code, is amended to read as follows:

`Sec. 2261A. Stalking

`Whoever--

`(1) travels in interstate or foreign commerce or within the special maritime and territorial jurisdiction of the United States, or enters or leaves Indian country, with the intent to kill, injure, harass, or place under surveillance with intent to kill, injure, harass, or intimidate another person, and in the course of, or as a result of, such travel places that person in reasonable fear of the death of, or serious bodily injury to, or causes substantial emotional distress to that person, a member of the immediate family (as defined in section 115) of that person, or the spouse or intimate partner of that person; or

`(2) with the intent--

`(A) to kill, injure, harass, or place under surveillance with intent to kill, injure, harass, or intimidate, or cause substantial emotional distress to a person in another State or tribal jurisdiction or within the special maritime and territorial jurisdiction of the United States; or

`(B) to place a person in another State or tribal jurisdiction, or within the special maritime and territorial jurisdiction of the United States, in reasonable fear of the death of, or serious bodily injury to--

`(i) that person;

`(ii) a member of the immediate family (as defined in section 115 of that person; or

`(iii) a spouse or intimate partner of that person;

uses the mail, any interactive computer service, or any facility of interstate or foreign commerce to engage in a course of conduct that causes substantial emotional distress to that person or places that person in reasonable fear of the death of, or serious bodily injury to, any of the persons described in clauses (i) through (iii) of subparagraph (B);

shall be punished as provided in section 2261(b) of this title.'.

(b) Enhanced Penalties for Stalking- Section 2261(b) of title 18, United States Code, is amended by adding at the end the following:

`(6) Whoever commits the crime of stalking in violation of a temporary or permanent civil or criminal injunction, restraining order, no-contact order, or other order described in section 2266 of title 18, United States Code, shall be punished by imprisonment for not less than 1 year.'.

> This is the situation: I have a Jeep Wrangler, on the rear of which I

> have a trail rack (for cargo, and mounting Gerry cans). Over the last few years, the trail rack has become my mobile antenna farm, hosting a Diamond NR770 NMO dual band whip, a 1/2 wave Larsen base loaded NMO 220MHz whip, a 1/2 wave Larsen base loaded NMO 144MHz whip (for APRS), and a Larsen VHF-UHF-800/900MHz NMO center loaded monitor antenna. For HF, I mounted a K400 mount with 3/8" stud for a Lil' Tarheel II compact screwdriver (16" body, plus 5' whip), on the left rear corner of the trail rack (about 6' off of the ground). This location puts the antenna at a high point at the rearmost location on my Jeep. Being a short wheelbase vehicle with a 3" lift and 32" tires, the ride is inherently bouncy. The daily commute on the I-405 in the South Bay of the L.A. basin injects speeds of 5 to 70MPH during the commute. To date, I have cracked the base plate of the trunk lip K400 mount around the front edge of the round protrusion where the adjustable head of the mount supports the antenna. Twice, on separate new K400 mounts. The K400 is too flimsy (the fact that it is being made in China from metal not of the same original stainless grade as the original article is a separate issue) to support the stiff antenna, which is bounced and rocks front to back and side to side on every bump, dip, and pothole. Complicating matters is that the mount is at the rearmost and highest point on the rear of the vehicle, and the momentum of flexation is greatest at this spot. However, it is the absolute best spot to mount the antenna for performance and loading (perfectly flat on all bands 10 through 75M).
>
> My Alinco DX-70T only delivers 100W, and when mobile in motion, doesn't always have enough punch, so I enlisted an amp that would provide me with about 200W PEP, the max. rating of the Tarheel II. The amp exceeded this a few times, and after replacing the coil once, Tarheel informed me that a new compact version was under development, with a max. rating of 500W PEP. Armed with this knowledge, I installed an Ameritron ALS-500M with remote and soon abandoned the K400 and smaller Tarheel II for the heavier duty Tarheel "Stubby" (16" body with 5' whip) and a new Hustler stainless ball mount. Worked great, but within two weeks, upon arriving at my office one day, a co-worker asked me if my antenna had broken. When I went out to check, the antenna had rotated down at a 45� angle into a big 6.5' curb feeler mode into the left parking space next to me. I removed the antenna, and found that the outer ball half had cracked at the 3/8" stud that protrudes from it, causing the ball to loosen and slip. The candy store was nice enough to replace the part under warranty, and that night I was back on the air.
>
> A couple of weeks later, I noticed (during my daily mount checks provoked by the paranoia of losing a $350+ antenna on the freeway, and causing an accident, to boot) that some "wiggle" had developed between the 3/8" stud exiting the outer ball half, and the outer ball half itself. Enough movement to make me fear that another 30 or 40 miles would be enough to snap off the antenna cleanly from the replacement ball mount, unexpectedly. I removed the antenna, and searched for a stronger mount. I remember the old Motorola stainless ball mounts from the Broderick Crawford 2150 days, and that they were nearly bullet-proof. I also remembered that Antenna Specialists made them for Motorola (ASP-3, or something like that). These are as rare as $3 bills nowadays, since A/S abandoned making them. However, I collected an ancient Batwing ball mount

> with a cracked gray phenolic base (too bad, as that's where the Moto
> branding was) years ago at the swapmeet, so I tore my garage apart and
> finally located the old gem. I retired the Hustler stainless hardware,
> and installed the Moto / A/S stainless hardware into the black phenolic
> Hustler baseplate. Perfect fit, and very tight mount (no slop at all).
> About three and a half weeks have passed, and I have just discovered the

> 73 de Doug, N6XQY

Doug,

If I understand you correctly, you have changed over to a sort of full-sized screwdriver? If so, I might suggest that you got to a slider mount that slips into the end of a Drawtite or Reese hitch. It is shaped like a reversed "F" with the center bar of the "F" facing to the outside of the hitch. It seems you ARE suffering from vibration severe enough to cause the kind of damage you are experiencing. *IF* you ARE using basically a full-sized screwdriver, the advantage of this is you can secure the antenna FULLY at the top of the now upside down "F" with a piece of Lexan (non-conductive). It firmly prevents any "wiggle" and absorbs most of the shock by taking most of the strain off the bottom of the antenna and spreads the load across a wider area. Granted, it is better if you can have the antenna up and away from ground losses, but my experiences have been that the securely fastened, essentially bumper-mounted antenna works quite well-and, of course, prevents the extreme shocks that a single-point mount must absorb on its own.

I hope you find a solution and I hope that I might help in your search for what has to be a very frustrating problem for you. I, too, am heavily involved in emergency comms (CAP) and I have a 3" diameter antenna that has been mounted on my Chevy S-10 for 2 years + with no problems. If you hit the mount, it would probably destroy the antenna and mount.

73

Its nice to live in a town where you can actually walk into Mouser and
Allied :)

Ref Mouser I too finally got in touch with them via email
and they said they would be happy to put me on their mailist
for a Catalog, that was about 3 months ago.  No catalog
received yet.

Anyone out there mounted an FT-857D in a Mazda B4000 pickup? I have a 1997 B4000, 5-speed, 4WD, and want to put my FT-857D in the truck.

Antennas are no problem -- I will use two stake hole mounts from GeoTool and mount two antennas in the rear stake holes -- VHF/UHF and ATAS-120. Coax will route inside the sides of the bed, under the cab, and into the cab through a hole I drilled in the cavity where the jump seats stow.

The body of the radio will mount on the floor under the driver's seat. Antenna cables will run under the carpet to the radio coming out through a small slit in the carpet. Power cable comes from the battery, over the wheel well, under the truck and up through a hole similar to the antenna cable, then under the carpet to the radio body.

Question is: Where to put the control head?

If I mount it on the floor between the gear shift and the front edge of the seat, I have to lean WAY over to operate the knobs. I could build some sort of platform that secures to the floor between the gear shift and the front edge of the seat, thereby elevating the control head so it's within easy reach.

Another thought I had was to remove the stock AM/FM radio -- which is a double-DIN size -- and replace it with a standard DIN-sized radio. This would leave a DIN-sized hole in the dash where I could put a metal plate painted flat black and mount the control head there, putting it generally in the same place as the car radio.

Any assistance will be appreciated.

I'm working on an EF Johnson 1200 series 440 MHz repeater.
One of the transistors in the transmitter is fried, and I have had
no luck finding a replacement. Can anyone help with a cross
reference?

the Johnson part number is 576-0004-055

Its a white, ceramic case with the 4 wide leads. Many RF power
transistors of this type have a stud to attach it to a heatsink.
This one does not.

It has the Motorola symbol, but only the Johnson part number.
I've looked though Motorola data books and cannot even find
this package style.

Steve

Anybody parting out a Drake 2A or 2B receiver?

I need a cabinet and a set of knobs for a 2B that I'm
bringing back to life.  It was damaged during shipment
due to very poor packing.  The condition of the paint
on the cabinet is not important, as long as the metal
is not dented, bent, or badly rusted (light surface
rust is okay).  I'll strip and repaint it.  The knobs
need to be good ones with no cracks and decent chrome.

Can somebody help me out here?

73,
Dean K5DH

Finally talked to the right folks at Johnson.
If anyone needs info on older equipment, call
the factory at 800-295-1773. The normal service
group has no info on equipment made before 1999.

                         Steve
p.s.-my transistor is an MRF628, which I'm now
searching for

Hi Dean,
Sorry to hear of the damage to the Drake.
If you end up repainting (and you likely know this) use a Rustoleum Auto Gray Primer over the bare metal and follow it with Rustoleum satin black #7777- a very nice match for the 2A/2B- perhaps 2 coats with wet sanding in between to remove any dust/dirt. MY painter lost my silk screen and artwork for the 2B, so no more front panels.

GL,
Dale W4OP

Clark, Did you should read that listing carefully? That price includes not only 104 of those receivers, but a 5K generator and a 24 foot concession trailer.

Ed

   Sometimes you have to wait for the next printing.  You should have
asked for their CDROM, too.

Jayseebee wrote:

> Actually we (retired and Ex ATT,Bell,SBC and now ATT again) used to do a frequency run test with an audio signal generator and a receive measuring device at the far end. If needed we would put in a equalizing unit (Wescom, Teltrend, etc) that we could adjust the 300-to 3khz slope (sometimes up to 8khz for audio program loops for radio broadcast) with to make all frequencies as flat as possible or boost the level of the freqs as needed. You can get even more technical in the time delay at different frequencies on the same copper path traveling from one end to the other. Lets see what this stirs up.
>
> JCB

I was a US Army broadcast engineer at Ft Greely, AK back in the early '70s. Our AFRN network feed came through the "White Alice" microwave network. By the time it reached our station the level was so low that I

had to use a spare magnetic phono preamp from our old transcription
turntable to bring the feed up to line level. Before that, when they
went from network to live, or back to the network they had to reset the
levels. Repeated requests were made to fix the feed, but we were always
told that the level was ok in Fairbanks, and the problem must be on our
end of the feed because the phones worked.

As I recall, the telco-techno correct language for that is: "the trouble is
leaving here ok,"  which is used almost as often as: "trouble came clear
while kicking bay."

I am looking for an Antenna and Manual for the TrueTime Model 505-106 GPS-TMD, GPS Synchronized Timing Module/Receiver. The Antenna employs a 15-pin DB connector on the end of its interconnecting cable.

Thanks for passing the word along the network.

FS Mint Kenwood TS-480SAT with over $500 worth of accessories including the
VGS-1 Voice Guide and Storage Unite, the SO-3 TCXO Unit,
the YF-107C 500 Hz CW Filter, the YF-107CN 270 Hz CW Filter, and the
YF-107SN 1.8 KHz SSB Filter. Cost over $1,500 current prices.
My price is $1,025 including shipping to lower 48. Also included is the
original boxes for the transceiver and the power cord, manual, hand mic ,
etc.
It all works perfect and looks new. Less than 100 hours on the rig. Also
have an as new Kenwood PS-53 for sale. The PS has the
original boxes and manual. Price is $175. Thanks, Charlie Hugg, K5MBX

I am in need of someone with a Icom 756pro or Pro II or III
service manual.
I would like to find out how to take the glass off the display?

I want to replace it because i have a scratch (Not to noticeable)
But it's still there and if possible to replace. It looks like and easy
fix.

Thanks for any help.

Steve

```

In my packing I found a Fluke TRENDAR 200 IC TESTCLIP that I do not
need. It looks complete and includes the manual. Used for in-circuit

and chip testing of most 74XX series devices. Foam rubber inside is
ratty, but the plastic carrying case is like new.
$75 plus shipping.

I have two working dumb terminals.
Used them on packet.

Free; but you have to come and get them.
I am in Lexington, MA

hey Al
i have never known anyone who used the ADI
but if all you want is 2meters i would suggest the Icom V8000
it is a 75watt rig and under $200 a real nice radio and easy to use
good luck

  My Kenwood TS-450sat has both 2.4 KHz filters installed and only the
500 Hz CW positions empty.  I would like to install the YK-88SN-1
filter.  Can I plug the YK-88SN-1 1.8 KHz filter in one of the open
positions normally used for the 500 Hz CW filter?    I'm hoping to be
able to use the two 2.4 KHz filters for normal operation, and then
switch to the 1.8 KHz filter in the 500 setting when someone is parked
closer than 3 KHz away.

Thanks in advanced..

-Michael

That is exactly the way my TS-450sat is configured - works great.

I also have a YG-455CN-1 250 Hz filter in the 455 kHz slot and end up with
the best of both worlds.

Dave

Summary: I need instructions on how to open ICOM BP160 or BP-131 packs.
Keywords: open disassemble replace ICOM BP-160 BP-131
User-Agent: slrn/0.9.7.1 (Linux)
Xref: g2news1.google.com rec.radio.amateur.equipment:2072

Hi guys,

I have a BP-160 and a BP-131 pack that are dead. I'd like to "refill" them with locally available batteries, but can not get them open.

I'm in Israel, so it is not possible to just order a replacment or a refill kit from the U.S. and there is NO ICOM dealer in this country.

I tried warming them with a hair dryer, but it did not seem to have any effect. If they are sealed with melted glue, eventualy the heat will open them, if they were ultrasonicly welded then I need to use a dremel :-(

I found one web site that sells replacement inserts, but there was no information I could find on the web on how to open them in the first place.

Any help would be greatfully appriciated.

Thanks in advance and 73,

Geoff.

Hi Geoff,  I believe they are ultrasonically welded together.  What does
work (most of the time)
is to put the battery pack in the freezer and let it stay in there for
an hour or so.
When you take it out I usually put it on a solid floor with a "smack".
DON'T throw it, smack it down.
Most times this works fine.
If you smack it to hard, you may crack the case.   Even if you get it
opened a little bit you can usually
split it further with a flat blade screwdriver.  I have been doing this
for many years now, usually with good results.
In the days of the Icom IC-2AT or the IC-02ATs, the battery pack was
screwed together making it super easy
to refill it.    Good Luck to you..

I have for sale a nice Malcomized Yaesu FT-102 Station:
1. FT-102 fully Malcomized by Malcolm Eiselman, NC4L, with little use since
work was done 8/26/03. Over $600 charge.  Transceiver has AM/FM Board,
    XF-455C CW Filter not installed, Handmic, Power Cable, Original Manual.
Works great, 200 watts out. Cosmetically, it is very good. It does have a
few small
    scratches around front trim, but not bad. Front Panel and Cabinet are in
great condition. Also has 455 IF AM Filter installed.
    All documentation from Mal included. Price is $775;
2. FV-102DM Synthesized digital VFO with Memories. Very stable. It has also
been gone over by Malcolm in Dec. 2005 and works perfectly.
    Cosmetically, it is very good. It comes with original manual and all
cables. Price is $375;
3. FC-102 Antenna Tuner. In as new condition with Original Box. Works
Perfect and looks new. Meter lights work. Comes with Original Manual and
    the cable for the the meter lights. Very little use. Price is$325
Shipping from 79602 extra. Package price for all items listed is $1375.
Digital Pictures available. Thanks, Charlie Hugg, K5MBX

Put them in a freezer for a couple of hours, THEN put a utility knife
blade on the seam, and tap a couple of times with a small hammer...
Works great with the older Standard  battery packs and I don't see why
it shouldn't with old Icom battery packs...

The ICOM R100 covers 100 kHz to 1856 MHz in AM, FM and FM-Wide. It has
an an LCD display and tuning via knob, keypad or 100 memories. The rear
panel has 3 antenna inputs.

This receiver is NOT cellular blocked. $300 + shipping.

And, you think acting like a "boy scout" is bad? I'd a whole lot rather be approached by a "boy scout" stranger than anyone who thinks they're weird.

Get your head on straight.

I ordered the YK-88SN-1 from HRO yesterday after reading your
reply. It looks like the YG-455CN-1 has been discontinued. Inrad has
a similar filter available for the Kenwood 450, but it is $155.00.
Perhaps I'll watch Ebay for awhile and see what comes up.

Thanks for your help.

-Michael

I have a nice copy of the 55 page HR-2510 service manual.
Price schedule:
20 wpm Extra: free
13 wpm Advanced: $5
13 wpm General: $10
5 wpm Tech+: $15
5 wpm Novice: $20

5 wpm Extra: $25
5 wpm Advanced: $30
5 wpm General: $35
0 wpm Tech: $5,000.

(Buyer also pays postage -- about $4 via Priority Mail)

73,

You left out the 13wpm Extra.  Would that be $2.50?  :-)

InvisibleHamAntennas.com - - domain name is for sale.  The is one of a
number of domain names that I own.  I just do not have the time to
develope this name so I am selling it.  The price is $50.  Transfer
costs should be about $7.50.

Click on this link to see the parking page:
http://www.InvisibleHamAntennas.com

Thank you for looking.

Bill

I don't think a 5 wpm Advanced exists.  Wasn't Advanced class taken out of
the upgrade path when the 5 wpm classes were established?

I posted that tongue-in-check. It would go for free to the first ham
who responded, and it so happened that an Extra did respond.

The radio activity is caused by the glow in the dark meter markings. More
tree hugger bull crap.

>>
>> Just how radio active the needles are was not mentioned. Also I

It's nothing to worry about. They are no different than the "glow in the dark" clock and radio dials from back in the 40's 50's and maybe 60's. There was a small amount of radio active material mixed in with the phorphour causing it to glow.

>> suspect that some R390A went to MARS members and may not have been
>> demilitarized. I had one for many years and this was the first I
>> heard about the needles.

I'd guess this is just a CYA by the government after some lawyer realized the stuff was still out there. The material is *very* low level" and could be hazardous IF you get it in your mouth or a cut" and in today's sue happy society I can see why they might panic. However the stuff is basically harmless unless you provoke it.

I once broke a device in my hands with enough radioactive Cesium in it to really light up the counters. The hazmat team found the device in the lab under a metal pail, a string of clothes down the hall, and me standing in the shower. Again they said as long as I had not put my hands near my mouth, nose, or eyes or gotten the material in some cuts (the counter confirmed I hadn't) they said I did the right thing. BTW, I even got my clothes back. <:-))

Back in the days when they were making the dials, word has it that some of the women doing the painting were getting sick. They'd twirl the end of the brush on their tongues to keep a point on the brush and were ingesting the material.
>

For any one who has been around a while, look at how they treat mercury now and how we used to treat it 50 and 60 years ago.   Break a thermomenter and they close a lab while the hazmat team cleans up. We used to "silver" coins and rigs with the stuff and carry it around. I'd guess the Mercury is far more dangerous than any radioactivity from those dials and markings.

Radio Specialty Model 1179-22-1 Repeater-------------------$ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed, but inside is very clean!
Repeater is in a wall mountable battleship gray cabinet,
that is 4" deep by 13.5" wide, by 21.5" tall, and is
around 30# in weight. It is a VHF base/repeater used by
the BLM out west...
It also has on the front cover, I-5YACC, then under it is
271, under that VHF REPEATER. There are a lot of FCC type
acceptance # all over inside, plus the maker, and maker's
partial address, and part # for transmitter, and receiver
sections.
NO documentation.

2 Kenwood TR-7950-----------------------------------EACH---$ 80
Each comes with mobile mount, and 1st sale gets the
packet adapter. Are in very good shape, but do not include
the TU-79 PL boards which are available at www.piexx.com
They will not come in original box, and if I do not have
the manual, I will photocopy, or pdf one (your choice)...

Standard C468A LNIB---------------------------------------$ 75

LinkXcel PS-141B 4 port KVM Switch with 4 cables-----------$ 65
-Like New- This is the PS2/VGA model -No manual-

Pioneer DRM-602X Scsii cd changer that uses Pioneer--------$ 15
audio cd carts. -No manual-

Sanyo SCP5000-------------(Sprint)-9/10---------------BEST OFFER
1 desktop charger
2 AC adapters
2 12v adapters
1 data cord

Samsung SCH3500----------(Sprint)-6/10----------------BEST OFFER
1 extra battery
1 holster
1 desktop charger
1 12v adapter
1 data cord
NO MANUAL or BOX

Nokia 252-----------------(unknown)-8/10-------------BEST OFFER
2 extra batteries
1 holster
1 desktop charger
1 12v adapter
NO MANUAL or BOX

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

Pictures of the radios can be found at;
http://www.mantico.com/4sale.htm
I will have all items on line as soon as possible.

A few years back I put a Geiger counter within inches of an old Timex watch with a "radium dial" and it pegged out the meter. It was a significant amount of radiation if worn on your wrist. Worth the risk? Not for me.

Anyway have fun with your R390 and it's "radium dial" meter.

Short term, no effect. Long term, years, decades...unknown. Good luck.

I need to get a new battery for my Kenwood TH-G71 hand held and am thinking about going with an after market NiMH type instead of the OEM NiCad.

Two questions:

Are there any recommendations on where to purchase the NiMH battery?

Can I use the original charger on the new battery?

I'm just using the original BC-17 wall charger and the manual says to charge the stock PB-39 NiCad for 15 hours. How do I know how long to charge the NiMH battery and/or how do I know when it's fully charged?

Any info on this is greatly appreciated.

73,
Bruce

NiMH has some advantages and some disadvantages over NiCD. Biggest
and most obvious advantage is greater capacity. Biggest disadvantage
is a somewhat higher self-discharge rate - NiMH batteries can lose
20-30% of their charge per month just sitting on the shelf un-used,
while NiCd batteries can hold their charge quite a bit longer.

For this reason, NiMH is probably not the best choice for
batteries/packs which will spend weeks or months sitting in your ARES
"go-pack" - they'll probably have self-discharged just when you need
'em.

I'm told that some of the new NiMH batteries have a greatly reduced
self-discharge rate, but can't recommend specific types or brands.

>Two questions:
>
>Are there any recommendations on where to purchase the NiMH battery?

I've been happy with the couple of purchases that I made from Batteries America (http://www.batteriesamerica.com/). We bought a bunch of the 6-AA-cell battery holders for the Icom W32, and the fit/finish/function of the cases seems as good as Icom's own product at a rather lower cost.

They have several different packs for the TH-G71 available. You get your choice of NiCd or NiMH, with several different combinations of battery voltage and battery capacity. If you'd be satisfied with a maximum transmit power of 3 watts you could go for the NiMH 7.2V 1800 mAh pack, or for full transmit power get any of three 9.6V packs (600 mAh NiCd, or 1100 or 1450 mAh NiMH).

They can also sell you cells, or complete insert sets, if you want to try cracking open your existing battery pack and rebuilding it.

Other vendors may also provide you with a similar range of choices.

>Can I use the original charger on the new battery?
>
>I'm just using the original BC-17 wall charger and the manual says to charge the stock PB-39 NiCad for 15 hours. How do I know how long to charge the NiMH battery and/or how do I know when it's fully charged?

As a general rule, you _can_ use a charger designed for NiCd batteries with NiMH batteries, but may not get the best results (in terms of total capacity and/or number of charge/discharge cycles).

The PB-39 sounds like a standard "trickle" charger, with a low and coarsely-regulated charge current. You can probably use this, and just multiply the original charge-time specification by the ratio of the packs' capacities. If the stock pack took 15 hours and was in the range of 600 mAh, then an 1100 mAh pack would take almost 30 hours.

For fast-charging, it's best to have a charger which "understands" the charge-cutoff behavior of NiMH batteries. A fast-charger for NiCd batteries will usually charge until the battery starts to heat up... this can be detected because the battery's terminal voltage stops rising, and actually starts falling a bit. The charger detects this "negative delta V" condition and shuts off the charge (or switches back to a trickle-charge).

This method will actually overcharge a NiMH battery. NiMH is happier with a "zero delta V" shutoff... the charger switches off the fast-charge when the battery voltage stops rising, before it begins falling.

Getting the best out of a NiMH battery seems to be a someone controversial topic... not unlike the question of charging gel cells, AGM batteries, and so forth. Lots of opinions, not a lot of completely solid answers. The best information I've been able to find about NiMH suggests:

- The best recharge regime is a fast-charge (at C/2 rate or so), with several different mechanisms used to detect full charge and shut off the fast-charge current: zero-delta-V, a temperature-rise sensor, and a timer for safety.

- Following the fast-charge with a few hours of low-current trickle charging can be beneficial in cramming the last little bit of capacity into the battery.

- NiMH batteries may not deliver their full advertised capacity until they've been through several cycles of "full charge, nearly full discharge."

- Like NiCds, it's best not to run NiMH batteries all the way down to zero - they don't like the resulting "reverse charging" impact on their weaker cells. When they're drained to 1.0 volts per cell, consider them fully discharged!

- If you're going to store NiMH batteries for an extended period, discharge them to the 1.0 volt level first. Recharge 'em before you use 'em.

That appears to be the company that took over
Transworld.................you can see some of this equipment in the Jane's
Millitary Manuals. Nice equipment. I had a couple of TW100s for awhile, or
were they TW1000s?
It's been a few years.

Pete

```

I have a Yaesu FT-102 HF Transceiver for sale. This one was Malcomized by Mal, NC4L in March of 1997. It has had all of the relays replaced plus other upgrades performed by Mal. It has a CW Filter but no AM/FM Board. Cosmetically it is in good but not mint shape. The cabinet looks good and the front panel is nice. There are some nicks and scratches mainly on the trim around the front panel. It works but has problems. On bands above 20 meters, sensitivity is low as is power output. It loads up to over 100 watts on 20. On 40 meters the VFO does not change frequency. One meter lamp is burned out. Price is $425 plus shipping. No mic or manual. Thanks, Charlie Hugg, K5MBX

Motorola claimed that their NiMH cellular batteries for the old "flip phones" lost as much as 1/3 of their charge in the first week. My casual experiments showed me they were pretty close.

Contrary to many maker's claims NiMH cells do develop "memory". When flip phones were popular people used to give me their old batteries that would no longer hold a charge. 99% of them were NiMH and most of them came back to normal after being "reconditioned".

They were reconditioned by a charger that did three discharge/charge cycles in a row. It was a "smart" charger, it could determine if a battery was NiCad or NiMH and charge accordingly.

>
> For this reason, NiMH is probably not the best choice for batteries/packs which will spend weeks or months sitting in your ARES "go-pack" - they'll probably have self-discharged just when you need 'em.

> I've been happy with the couple of purchases that I made from Batteries America (http://www.batteriesamerica.com/). We bought a bunch of the 6-AA-cell battery holders for the Icom W32, and the fit/finish/function of the cases seems as good as Icom's own product at a rather lower cost.

I've never dealt with them, but my recemendation is for AA packs.
You can charge them more easily in stand alone chargers, mine will do six at a time. You can also keep a set of NiCads or alkeline batteries for an emergency spare.

If you do keep a set of alkeline batteries make sure to buy a good brand, and rotate them.

> They can also sell you cells, or complete insert sets, if you want to try cracking open your existing battery pack and rebuilding it.

Being far away from ordering the batteries from companies catering to the ham replacment market, I've done it often with battery packs sold for cordless phones. They come in many sizes and capacities. Make sure to remove and re-install any diodes, heat sensors, fuses, etc in the old pack.

> As a general rule, you _can_ use a charger designed for NiCd batteries with NiMH batteries, but may not get the best results (in terms of total capacity and/or number of charge/discharge cycles).

I agree with that. It's also important to make sure that your charger really does work propely. Over the years, I've bought several used packs that were "cooked" by bad chargers, or overcharging. I've even had an Icom one that cooked batteries on its own. :-(

Geoff.

Help: Ameritron AL-82 blown fuses
I bought an Ameritron AL-82 and it sat for over a year.
Worked perfect before that.  Now when you turn it on
the two fuses on back of amp blow. So I replaced the two fuses
and this time I left the top cover off and it comes on. No problem.
The minute you pust the button down where the top cover goes on, it
will blow the two fuses again.   The button is a safety feature.
Can someone tell me what I may need to check and replace?
Thanks and Happy New Year.............Rich

Why can't someone come up with a simple one-sentence or one-paragraph answer in human language such as "I like it - it was easy to build and easy to operate" (or the opposite) before spewing out a string of URLs?

Here's mine -

I don't own one yet, but I have several ham friends who do and are totally pleased with it. I may get one this year (2006) but I will have to have someone build it for me (yes, there are folks who will do that) because I'm partially blind and can't do fine soldering anymore.

There - was that so hard?

Free Competition - Last few days!

Our free competition to win an Icom IC-V82 handheld transceiver,
closes at midnight on the 4th of January, 2006.
So, you only have a few days left to get your entries in.
Remember, 'You've got to be in it to win it'

So go to http://www.southgatearc.org/competitions/ic-v82.htm
for your last chance of winning this fabulous prize.

Good Luck!

May I also take this opportunity to wish all readers a
Happy and Prosperous New Year

```

Hello John
The K-2 is a very good radio, don't know how much experience
you have with kit building, but would not try the K-2 as first bite
it has taken some op's months to finish their K-2
If you have lots of solid state kit experience
go for it, if not try geting a few smaller projects under your belt

started playing around building qrp kits about 5 years ago
had not built a kit since the 60's
found out first thing
new solid state radio parts, are not big and beefy like the old days

that with out a good magnifying light
(not a cheep magnifying light, found out the hard way, had to go out
and buy a good light, after I had wasted cash on the cheep one)
I could not even id the parts #'s,
also
had to also buy a good soldering station few other tools
but then, I was on my way

built a 2 fer transmitter and then a dc style receiver,

then the Red Hot Radio Nor Cal 20
when I opened up the parts bag
thought oh no,
I have truly biten off more than I can chew

did not try to act like I was
big time radio op, ex signal corps microwave radio repair
and think I could short cut or 2nd guess building steps

took my time followed instructions to the letter

8 hours latter was finished and it worked,
since then have built about a dozen other new age qrp style kits
have had lots of fun, wonders of wonders all of them worked first try

this is from a hard core lover of tube gear
you can see some of my simple tube transmitters in oct 05 CQ mag

what to first build depends on your experience, skills, and
how brave you are, yes some ops with out any kit building
experience have built the K-2

Small Wonder Labs makes lots of very nice easy to build kits
Love my 40 meter DSW, lots of fun in a very small box,

might want to try a easy simple, cheap kit
before you melt solder, on a radio kit that set you back over $1,000

but man oh man, yet to talk to anybody that owns a K-2
that does not love the radio

yours truly Mac dit dit

Yep, the lid has a safety interlock switch, which prohibits power being applied while the lid is open, and exposing lethal high voltage to an unqualified snooper.

Usually the first things to check after equipment has been idle for a period of time is the power supply filter capacitors. While you're in the vicinity, check the rectifiers too... just in case a leaky filter capacitor took one or more of them out. Either will eat fuses as fast as you put them in.

The Elecraft rigs are kinda the Cadillacs of the QRP crowd nowadays, very nicely reviewed in QST in the past year or two.

I recently built a Ten-Tec QRP kit transceiver. Main thing I can tell you is parts for rigs nowadays are way, way, way smaller than the parts used by rigs like Heathkit in the 50s, 60s and 70s. But if your eyes are good and your hands are steady and you have the proper tools, the Elecraft rigs should go together about as well as any other.

Just make sure you have a strong light and an even stronger magnifying glass :-)

There is no scam. Radio Mart is a legetimate e-Bay reseller
of refurbished ham radio equipment and accessories. There is
no difference between how Radio Mart does business and
other retailers like HRO, AES and others.

The problem here lies with a few usenet knuckleheads and cheap bastard hams who pontificate about all so much 'sour grapes' over them. (most or all of em' being ex-hamfest dealers who just don't like e-Bay!)

Something, in perspective, so common of the minority of cheap ham radio op's we all used to see at the hamfests years ago. The hams that used to walking around in dirty 10 year old clothes who never had a good word for anything or anybody so they cast their bile on that which they could or would not simply walk away from because the radio on the table was "too expensive" for them. In short it's cheap-assed cranky old men who act like spoiled 8-year-olds.

If they don't like Radio-Mart you'd think they'd just go buy new stuff at HRO and AES. R-M has to be doing something right as it appears each and every auction they put up ends with someone bidding on something. I say more power to them, and if someone don't like how they do business, they can go down the street to the next corner Deli on the block and get a pastrami-on-rye from them instead.

Thanks so much for your advice. Yes, that seems to be the consensus.
Elecraft seems to have a great service record and the K-2 is
well-designed. I put together 3 Heathkits back in the 70's. the most
difficult was a mobile 2M XCVR...seems most like the K-2.

John

Radio-Mart(RM) is a deceptive seller that has cause more than a few buyers to get negative feedback. I like how the R390A he sells is Collins "designed", which is not the same as Collins built.

If Radio-Mart(RM) was an honest broker, then there would be no need for the private sales.

I often see items for sale from Radio-Mart(RM) that I want, but I won't buy from Mr. Red Velvet. Just wait a bit longer and a better deal will show up on ebay. There is no need to deal with Radio-Mart(RM).

```

The "private" sales stem from many folks here contacting his bidders warning them about his supposed questionable character. One or two folks here found his online auctions and started calling him a crook, then many more folks who have never had a single dealing with him joined the bandwagon.

Radio-Mart isn't doing anything different than the normal used gear seller... he just doesn't hide his practices as well. Millions of salespeople use these tactics all day long. If true problems develop Ebay will pull his registered status or kick him off, but he's far from being that bad. The situation concerns him, his buyers, and Ebay... everyone else is either jealous, enjoys causing trouble, or can't afford his stuff. If you don't like his practices, then don't bid.

"Radio-Mart isn't doing anything different than the normal used gear seller... he just doesn't hide his practices as well. Millions of salespeople use these tactics all day long."

Nice justification. I'll be sure to ignore your advice in the future.

Radio-Mart is into buying radios on Ebay and then turning around and selling them on Ebay for a higher price and pocketing the difference. It makes perfict sense to look for radios that are undervalued and then resell them. I and most other people have no problem with that. The problem is he does not tell the truth about where he got the radios and the condition of the radios. I don't understand why he is compelled to do tell stories about the radios he sells but it does not generally cross the line into outright fraud and treads around in a grey area so he will continue to be controversial topic in the news group. Going "private" will further take his sales into the grey area and apparently that and the story telling are risks he is willing to take. Buyer beware.

I have not contacted nor am I aware of anyone else who has contacted bidders about Radio Mart auctions. They may have read about him on Usenet, which would eliminate any reason to contact them.

I don't care one way or the other about Radio Mart but people that buy from him should be informed about the way he conducts his business.

Yeah, right! I've been ripped off by that bastard too(along with

```
numerous others). Claimed the radio was near perfect, found it had been
repainted (not discernable from poor photo) and it smoked after I got it out
of the box. Lets not forget the Shill Bidding he does from his gottahaveit
account!!!!!!! Don't try to defend him, he keeps getting the same negatives
after all these years which shows us, he's still playing the same games with
some defective gear and covering himself with the "Private Sales".

I would like to buy the 146.20 / 146.80 pair of crystals
for a Heath HW-202.

The xtals are probably the standard used in many rigs (rcvr has
10.7 Mc IF; xmtr mutiplication factor is x24).

I have a Yaesu FT-102 HF Transceiver for sale. This one was Malcomized by
Mal, NC4L in March of 1997. It has had all of the relays replaced plus
other upgrades performed by Mal. It has a CW Filter but no AM/FM Board.
Cosmetically it is in good but not mint shape. The cabinet looks good and
the front panel is nice. There are some small nicks and scratches mainly on
the
trim around the outside of the front panel. It works but has problems. On
bands above 20
meters, sensitivity is low as is power output. It loads up to over 100 watts
on 20.  On 40 meters the VFO does not change frequency. One meter lamp is
burned out. Price is $375 plus shipping. No mic or manual. Thanks, Charlie
Hugg, K5MBX

I called them about a unit I bought USED.

The gentleman answered my query and was polite and businesslike.

No complaints.

k8vf-

This is an interesting question. I thought the AT-250 was so old it couldn't possibly be auto-sensing. I found a portion of the manual at www.mods.dk, and agree that it isn't clear about it.

A box called "TUNE switch" says to tune the antenna and then turn the TUNE Switch off. It also says that after tuning is complete, the motor may activate during operation if you leave the TUNE switch ON. This suggests that it does have auto-sensing of a sort.

HOWEVER, the "CAUTION" on the first page, repeated on the last page of the manual, says you MUST limit power to less than 50 watts when tuning is initiated. When not tuned, voltages inside can be extremely high, and could cause damage to the transceiver. I suspect damage from arcing could occur inside the tuner as well.

Therefore, even if it has auto-sensing capability, it is not good practice to routinely rely on that alone unless there is some way to limit power.

Nowhere in the manual could I find a hookup with no control cable connected. Operating it that way would be at the user's risk.

Let's see your net nazi badge, or shut the heck up. I for one am tired of seeing 25 messages a day from some idiot that perceives a newsgroup violation.

Your name appears nowhere as moderator.

Amazingly enough, in my entire life I have only known one truely unredeemable butthole and his name was Golden as well... First name Ron, any relation?

Get a life!

To the Webmaster/slave

Could you change the format of the summary messages so that the links are on the next line down from the description, rather than just above the subsequent?

HNY, and all that.

George Hollis
Brunswick MD

I am looking for any suggestions as to reliable inexpensive electronic weather instruments.

With several units that I have tested from places like Target, Walmart, Radio Shack I find that they are not repeatable, readings drift and will die when the weather gets cold.

Has anyone found a source or brand that they have had good success with?

Any leads or links to building your own instrumentation?

Thanks

TMT

Radio Specialty Model 1179-22-1 Repeater-------------------$ 50
Appears to be complete, minus crystals.
I have no way to verify operation.
Has 2 settable PL tones...
Outside of case is scuffed, but inside is very clean!
Repeater is in a wall mountable battleship gray cabinet,
that is 4" deep by 13.5" wide, by 21.5" tall, and is
around 30# in weight. It is a VHF base/repeater used by
the BLM out west...
It also has on the front cover, I-5YACC, then under it is
271, under that VHF REPEATER. There are a lot of FCC type
acceptance # all over inside, plus the maker, and maker's
partial address, and part # for transmitter, and receiver
sections.
NO documentation.

1 Comspec TS-32P------------------------------------NEW----$ 35
New never used in original package complete with tuning tool, wire jumpers, switch chart for pl tone, and mounting tape plus original documentation/schematic.

2 Kenwood TR-7950-----------------------------------EACH---$ 80
Each comes with mobile mount, and 1st sale gets the packet adapter. Are in very good shape, but do not include the TU-79 PL boards which are available at www.piexx.com
They will not come in original box, and if I do not have the manual, I will photocopy, or pdf one (your choice)...

Standard C468A LNIB---------------------------------------$ 75

LinkXcel PS-141B 4 port KVM Switch with 4 cables-----------$ 65
-Like New- This is the PS2/VGA model -No manual-

Pioneer DRM-602X Scsii cd changer that uses Pioneer--------$ 15
audio cd carts. -No manual-

Sanyo SCP5000-------------(Sprint)-9/10---------------BEST OFFER
1 desktop charger
2 AC adapters
2 12v adapters
1 data cord

Samsung SCH3500----------(Sprint)-6/10----------------BEST OFFER
1 extra battery
1 holster
1 desktop charger
1 12v adapter
1 data cord
NO MANUAL or BOX

Nokia 252-----------------(unknown)-8/10-------------BEST OFFER
2 extra batteries
1 holster
1 desktop charger
1 12v adapter
NO MANUAL or BOX

All items will include manuals unless noted.
Shipping is NOT included on any item(s).

Pictures of the radios can be found at;
http://www.mantico.com/4sale.htm
I will have all items on line as soon as possible.

here's another...
http://www.circuitcellar.com/msp430/3b.htm

search circuit cellars website you'll come up with a ton of designs.

Both Oregon Scientific and Davis will do the job for you at reasonable
cost. Our OS WRM-968 wireless system has worked without failure for
over two years now. You can find out everything you ever wanted to
know about weather stations on the Ambient forum
http://ambientwxsupport.com/

"reliable" and "inexpensive" are at best orthogonal, if not downright
contradictory...

I just want the stuff to work.  Had a heathkit weather station for a
number of years, but when I worked 2m packet, it thought I was on
jupiter -- temperatures zoomed down and barometric pressure went
really, really high (and that was *after* I put RF bypassing on a lot
of high Z nodes, and shielded the thing).

I've had no trouble with the Davis Instruments stuff.  Currently run
Vantage Pro2 stations at a number of locations, using the Weather
Display software.

It's not cheap, but it works.

No license, no original software CDs....hmmmmm......and somehow it's RT Systems fault? If you cannot produce a license or original CDs, it's your fault and if I were RT Systems, I would think you pirated the stuff and why they won't help you. Best to put originals in a safe place or fireproof vault. It's your fault, not RT Systems.

For Sale: 4 - GE VHF 16 channel HH PCS Radios w/ batteries

Asking $200 for the set (includes CONUS shipping)

Photo links of radios:

http://home.cfl.rr.com/bologram/GE_RADIO_front.jpg
http://home.cfl.rr.com/bologram/GE_RADIO_rear.jpg
http://home.cfl.rr.com/bologram/GE_radios_all.jpg

I have for sale 4 GE - MA/COM Portable VHF (hand Held) Radios with batteries. The units are 150-173MHz, some wear, but all power up. They have BNC antenna jacks (no antennas though) I do not have the chargers yet. The units are SCAN models. Full specs from rear of radios:

GE Ericsson
FCC ID: AXA9MZ-PCSH3
DOC/MDC:PCSH
Serial #'s upon request

Either cash or consider trade for a BC246T scanner . E-mail me for more information or photos which 'll be happy to take.

Mitch

The Dallas 1-wire system has been popular.
North American mfg is in Mexico and
I saw that a European mfg started to build the same design.

```

Been out of Amateur for more than 20 years and would like to know when the Kenwood TM-331A came out and how does it compare to the Alinco DR-235T, both 220 transceivers? I know the Alinco can be modified but there is no info on the mod site re the Kenwood, not that it's important. Which one would you buy and why? All comments & opinions very welcomed. Thank you.

Cordially,
west
AF4GC
